Reliable CDCP Braindumps Ppt - CDCP Braindumps

We provide the best resources for the preparation of all the CDCP exams. We have curated guides for CDCP certifications. CDCP practice exam questions can be challenging and technical for sure. However, we have CDCP certified experts who curated the best study and practice materials for passing the CDCP exams with higher success rate. Our CDCP answers are verified and up to date products will help you prepare for the CDCP exams. All those professional who looking to find the best practice material for passing the CDCP exams should consider checking out our test products for better understanding.

EXIN Certified Data Centre Professional (CDCP) Sample Questions (Q34-Q39):

NEW QUESTION # 34
What should be considered when implementing hot- or cold-aisle containment in an existing computer room?

- A. Equipment will get too hot at the rear (back) of the rack potentially resulting in more ICT hardware failures.
- B. It will be more difficult to install power and network cabling in the contained area.
- C. The delta-T of the equipment will increase too much causing reliability issues.
- D. It creates potential issues with the existing fire suppression system(s).

Answer: D

Explanation:
Hot- or cold-aisle containment is a strategy to improve the cooling efficiency and reduce the energy consumption of data centers by

isolating the hot exhaust air from the cold supply air. However, implementing this strategy in an existing computer room may create potential issues with the existing fire suppression system (s), such as:

*The containment barriers may interfere with the distribution and activation of the fire suppression agents, such as water, gas, or aerosol, and reduce their effectiveness in extinguishing a fire.

*The containment barriers may create pockets of high temperature and pressure that could damage the equipment or the containment structure itself in the event of a fire.

*The containment barriers may obstruct the access and visibility of the fire detection and alarm devices, such as smoke detectors, heat sensors, or manual call points, and delay the response time of the fire suppression system(s).

*The containment barriers may violate the local fire codes and regulations that specify the minimum clearance and ventilation requirements for the data center.

Therefore, when implementing hot- or cold-aisle containment in an existing computer room, it is important to consider the impact on the existing fire suppression system(s) and take appropriate measures to ensure the safety and compliance of the data center, such as:

*Consulting with the fire authorities and the fire suppression system vendor to assess the compatibility and suitability of the containment solution with the existing fire suppression system(s).

*Modifying or upgrading the existing fire suppression system(s) to accommodate the containment solution, such as relocating or adding fire suppression devices, adjusting the discharge rate and pressure, or installing a secondary fire suppression system within the contained area.

*Installing fire-rated containment barriers that can withstand high temperatures and resist the spread of fire and smoke, and that have self-closing or automatic release mechanisms in case of a fire.

*Installing fire detection and alarm devices within the contained area and ensuring their proper integration and communication with the existing fire suppression system(s).

*Conducting regular testing and maintenance of the fire suppression system(s) and the containment solution to ensure their functionality and reliability.

NEW QUESTION # 35

The three elements of the fire triangle are,and. (Choose three.)

- A. Fuel
- B. Heat
- C. Earth
- D. Water
- E. Oxygen

Answer: A,B,E

Explanation:

The fire triangle is a simple model that illustrates the three elements that a fire needs to ignite and sustain:

oxygen, heat, and fuel. Oxygen is the oxidizing agent that enables the combustion reaction, heat is the energy source that raises the temperature of the fuel to its ignition point, and fuel is the material that reacts with oxygen and releases heat and light. Removing any one of these elements can extinguish a fire. For example, water can reduce the heat and the oxygen, sand or soil can smother the fuel and the oxygen, and fire extinguishers can displace the oxygen or lower the temperature.

NEW QUESTION # 36

Which of statements below is true?

- A. Single-mode cabling can use both LED and laser as a light source.
- B. Multi-mode cabling can cross longer distances.
- C. Single-mode cabling is more expensive than multi-mode cabling.
- D. Multi-mode cabling is more expensive than single-mode cabling.

Answer: C

Explanation:

Single-mode cabling and multi-mode cabling are two types of fiber optic cables that differ in their core diameter, wavelength, light

source, bandwidth, distance, and cost. Single-mode cabling has a smaller core diameter and uses a laser as a light source, which enables it to transmit data over longer distances and higher bandwidths. However, single-mode cabling is also more expensive than multi-mode cabling, because it requires more precise alignment and splicing, and more costly light sources and connectors. Multi-mode cabling has a larger core diameter and uses LEDs or VCSELs as a light source, which makes it cheaper and easier to install and maintain. However, multi-mode cabling also has a shorter distance and lower bandwidth than single-mode cabling, because it suffers from more modal dispersion and attenuation.

NEW QUESTION # 37

Which Class of Fires involves cooking appliances?

- A. Class A
- B. Class B
- C. Class K
- D. Class C

Answer: C

Explanation:
According to the EPI Data Centre Professional (CDCP®) Preparation Guide, Class K fires involve cooking appliances that use combustible cooking media such as vegetable or animal oils and fats (page 28). Class K fires require special extinguishing agents that can suppress the high-temperature flames and prevent re-ignition. Class K fires are different from Class B fires, which involve flammable liquids such as gasoline, oil, or paint.

NEW QUESTION # 38

Which formula can provide a simple 'cost of downtime per hour" without taking seasonality and other factors into account?

- A. Revenue/1024
- B. Revenue/8760
- C. Revenue/365
- D. Revenue/52

Answer: B

Explanation:
8760 is the number of hours in a year (24 hours × 365 days). Dividing annual revenue by 8760 gives a basic average revenue per hour, commonly used in downtime cost calculations.
