You must improve your skills and knowledge to stay current and competitive. You merely need to obtain the CISSP certification exam badge in order to achieve this. You must pass the Certified Information Systems Security Professional (CISSP) (CISSP) exam to accomplish this, which can only be done with thorough exam preparation. Download the ISC CISSP Exam Questions right away for immediate and thorough exam preparation. We have thousands of satisfied customers around the globe so you can freely join your journey for the Certified Information Systems Security Professional (CISSP) (CISSP) certification exam with us.

## ISC Certified Information Systems Security Professional (CISSP) Sample Questions (Q445-Q450):

### NEW QUESTION # 445

What is the role of IKE within the IPsec protocol?

- A. enforcing quality of service
- B. peer authentication and key exchange
- C. data encryption
- D. data signature

**Answer: B**

Explanation:

### NEW QUESTION # 446

What can be defined as a formal security model for the integrity of subjects and objects in a system?

- A. Bell LaPadula Lattice
- **B. Biba**
- C. Lattice
- D. Info Flow

**Answer: B**

Explanation:

The Handbook of Information System Management, 1999 Edition, ISBN: 0849399742 presents the following definition: In studying the two properties of the Bell-LaPadula model, Biba discovered a plausible notion of integrity, which he defined as prevention of unauthorized modification. The resulting Biba integrity model states that maintenance of integrity requires that data not flow from a receptacle of given integrity to a receptacle of higher integrity. For example, if a process can write above its security level, trustworthy data could be contaminated by the addition of less trustworthy data. SANS glossary at <http://www.sans.org/newlook/resources/glossary.htm> define it as: Formal security model for the integrity of subjects and objects in a system.

**NEW QUESTION # 447**

A company wants to store data related to users on an offsite server. What method can be deployed to protect the privacy of the user's information while maintaining the field-level configuration of the database?

- A. Encoding
- B. Hashing
- C. Tokenization
- **D. {Encryption}**

**Answer: D**

**NEW QUESTION # 448**

Which of the following enables the person responsible for contingency planning to focus risk management efforts and resources in a prioritized manner only on the identified risks?

- **A. Risk assessment**
- B. Business units
- C. Security controls
- D. Residual risks

**Answer: A**

Explanation:

The risk assessment is critical because it enables the person responsible for contingency planning to focus risk management efforts and resources in a prioritized manner only on the identified risks. The risk management process includes the risk assessment and determination of suitable technical, management, and operational security controls based on the level of threat the risk imposes. Business units should be included in this process. **NEW QUESTION # 449**

Which of the following is a set of data processing elements that increases the performance in a computer by overlapping the steps of different instructions?

- A. complex-instruction-set-computer (CISC)
- B. multitasking
- C. reduced-instruction-set-computer (RISC)
- **D. pipelining**

**Answer: D**

Explanation:

Explanation/Reference:

Explanation:

Pipelining is a natural concept in everyday life, e.g. on an assembly line. Consider the assembly of a car: assume that certain steps in the assembly line are to install the engine, install the hood, and install the wheels (in that order, with arbitrary interstitial steps). A car on the assembly line can have only one of the three steps done at once. After the car has its engine installed, it moves on to having its hood installed, leaving the engine installation facilities available for the next car. The first car then moves on to wheel installation, the second car to hood installation, and a third car begins to have its engine installed. If engine installation takes 20 minutes, hood installation takes 5 minutes, and wheel installation takes 10 minutes, then finishing all three cars when only one car can be assembled at once would take 105 minutes. On the other hand, using the assembly line, the total time to complete all three is 75 minutes. At this point, additional cars will come off the assembly line at 20 minute increments. In computing, a pipeline is a set of data processing elements connected in series, so that the output of one element is the input of the next one. The elements of a pipeline are often executed in parallel or in time-sliced fashion; in that case, some amount of buffer storage is often inserted between elements. Pipelining is used in processors to allow overlapping execution of multiple instructions within the same circuitry. The circuitry is usually divided into stages, including instruction decoding, arithmetic, and register fetching stages, wherein each stage processes one instruction at a time. The following were not correct answers: CISC: is a CPU design where single instructions execute several low-level operations (such as a load from memory, an arithmetic operation, and a memory store) within a single instruction. RISC: is a CPU design based on simplified instructions that can provide higher performance as the simplicity enables much faster execution of each instruction. Multitasking: is a method where multiple tasks share common processing resources, such as a CPU, through a method of fast scheduling that gives the appearance of parallelism, but in reality only one task is being performed at any one time.
