UiPath Automation Developer Associate v1 Exam Sample Questions (Q353-Q358):

NEW QUESTION # 353
Suppose a developer is working with a 2023 yearly calendar. To expand the calendar into a monthly view, the developer must always click on the 15th day of the current month and add an event.
The selector for the Event Date Element activity in March is presented as follows:
<wnd app='applicationframehost.exe' title='Month View - Calendar' />
<uia cls='Day' name='15 March 2023' />
How should the selector be altered to guarantee that it clicks on the 15th of the ongoing month?

- A. <wnd app='applicationframehost.exe' title='Month View - Calendar' />
  <uia cls='Day' name='15* 20 ?? ' />
- B. <wnd app='applicationframehost.exe' title='Month View - Calendar' />
  <uia cls='Day' name='15 * 2023' />
- C. <wnd app='applicationframehost.exe' title='Month View - Calendar' />
  <uia cls='Day' name='*15*' />
- D. <wnd app='applicationframehost.exe' title='Month View - Calendar' />
 <uia cls='Day' name='15 ? 20 ?? ' />

Answer: A

Explanation:
This is the correct option because it uses wildcards to replace the dynamic parts of the selector. Wildcards are symbols that enable you to replace zero or multiple characters in a string. They are useful when dealing with attributes that change dynamically in the selector. There are two types of wildcards: asterisk () and question mark (?). The asterisk () replaces zero or more characters, while the question mark (?) replaces a single character. In this case, the name attribute of the target element changes according to the month, but the day and the year remain constant. Therefore, the selector can be altered by replacing the month name with an asterisk () and the last two digits of the year with two question marks (??). This way, the selector will match any element that has the name starting with 15, followed by any characters, followed by 20, followed by any two characters. For example, the selector will match 15 March 2023, 15 April 2023, 15 May 2023, etc. The other options are incorrect because they either do not use wildcards, or they use them incorrectly. Option A does not replace the last two digits of the year, which may change in the future. Option C replaces too many characters with the asterisk (), which may cause ambiguity or false matches. Option D uses the question mark (?) incorrectly, as it should be used for single characters, not for spaces or multiple characters. References: Selectors With Wildcards

NEW QUESTION # 354
When a developer is examining a suspended state upon reaching a breakpoint, which activity will the Executor be directed to if Step Out is selected from the Debug section in UiPath Studio's ribbon interface?

S1

S2

S3

A1

Condition *

{} True

Then

W1

Text

{} Enter a VB expression

Else

Drop Activity Here

S4

W2

Text

{} Enter a VB expression

- A. S1
- B. W1
- C. A1

- D. S2

Answer: A

Explanation:
When a developer selects "Step Out" from the Debug section in UiPath Studio's ribbon interface while examining a suspended state upon reaching a breakpoint, the executor will be directed to the activity that called the current container (or the next activity in the higher scope). In the context of the provided sequence structure, stepping out from A1 (assuming that's where the breakpoint is) would go to the next higher scope, which is S2, as it is the sequence that contains A1. Therefore, the correct answer is D (S2 in the image).

NEW QUESTION # 355
What is the purpose of the Interval filter in the Orchestrator's Monitoring page?

- A. It enables you to sort the displayed data based on job priorities.
- B. It allows you to choose between background and foreground processes for the displayed data.
- C. It allows you to control the granularity of the displayed data and check the health of your system in either the last day or the last hour.
- D. It allows you to allocate licenses per machine for the displayed data.

Answer: C

Explanation:
Explanation
The Interval filter in the Orchestrator's Monitoring page lets you select the time range for the data that is displayed on the dashboard1. You can choose between Last Day and Last Hour options to view the performance and health indicators of your system at different levels of detail2.

NEW QUESTION # 356
What method can be used to change the index of an existing column in a datatable?

- A. SetOrdinal
- B. SetIndex
- C. SetColumnIndex
- D. MoveAt

Answer: A

Explanation:
The SetOrdinal method of the DataColumn class can be used to change the index or position of an existing column in a datatable. The method takes an integer argument that specifies the new ordinal or position of the column. For example, to move the first column to the last position, one can use: yourDataTable.Columns(0).SetOrdinal(yourDataTable.Columns.Count - 1). (UiPath Automation Developer study guide) References:

NEW QUESTION # 357
Where is the TransactionNumber incremented in the REFramework?

- A. In the New Transaction transition.
- B. In the End Process state in the Finally section of the Try Catch activity.
- C. Only in the SetTransactionStatus.xaml workflow.
- D. In the RetryCurrentTransaction.xaml workflow and in the SetTransactionStatus.xaml workflow.

Answer: D

Explanation:

The TransactionNumber is a variable that stores the index of the current transaction item in the REFramework.

The TransactionNumber is incremented in two places in the REFramework:

In the RetryCurrentTransaction.xaml workflow, which is invoked when a system exception occurs and the retry mechanism is enabled. The workflow increments the TransactionNumber by 1 and sets the TransactionStatus to "Retry". This allows the framework to retry the same transaction item with a new index. (UiPath ReFramework documentation2) In the SetTransactionStatus.xaml workflow, which is invoked at the end of each transaction to update the status of the transaction item and log the result. The workflow increments the TransactionNumber by

1 and sets the TransactionStatus to "Successful", "Failed", or "BusinessRuleException" depending on the outcome of the transaction. This allows the framework to move on to the next transaction item with a new index. (UiPath ReFramework documentation3)
