SPLK-1002 Exam is designed to test the knowledge and skills of individuals in various aspects of Splunk, including search commands, data models, and pivot tables.

Splunk Core Certified Power User Exam Sample Questions (Q183-Q188):

NEW QUESTION # 183

Which of the following options will define the first event in a transaction?

- A. startingwith
- B. firstevent
- C. startswith
- D. with

Answer: C

Explanation:

The correct answer is A. startswith.

The explanation is as follows:

The transaction command is used to find transactions based on events that meet various constraints¹².

Transactions are made up of the raw text (the `_raw` field) of each member, the time and date fields of the earliest member, as well as the union of all other fields of each member¹.

The startswith option is used to define the first event in a transaction by specifying a search term or an expression that matches the event¹³.

For example, `| transaction clientip JSESSIONID startswith="view"` will create transactions based on the clientip and JSESSIONID fields, and the first event in each transaction will contain the term "view" in the `_raw` field².

NEW QUESTION # 184

How does a user display a chart in stack mode?

- A. By turning on the Use Trellis Layout option.
- B. You cannot display a chart in stack mode, only a timechart.
- C. By changing Stack Mode in the Format menu.
- D. By using the stack command.

Answer: A

NEW QUESTION # 185

Which of the following knowledge objects represents the output of an eval expression?

- A. Calculated fields
- B. Calculated lookups
- C. Eval fields
- D. Field extractions

Answer: A

Explanation:

Reference: <https://docs.splunk.com/Spdexicon:Calculatedfield>

The eval command is used to create new fields or modify existing fields based on an expression². The output of an eval expression is a calculated field, which is a field that you create based on the value of another field or fields². You can use calculated fields to enrich your data with additional information or to transform your data into a more useful format². Therefore, option B is correct, while options A, C and D are incorrect because they are not names of knowledge objects that represent the output of an eval expression.

NEW QUESTION # 186

Which of the following statements describes POST workflow actions?

- A. POST workflow actions cannot use field values in their URI.
- B. POST workflow actions cannot be created on custom sourcetypes.
- **C. POST workflow actions can open a web page in either the same window or a new .**
- D. POST workflow actions are always encrypted.

Answer: C

Explanation:

Explanation

A workflow action is a link that appears when you click an event field value in your search results¹. A workflow action can open a web page or run another search based on the field value¹. There are two types of workflow actions: GET and POST¹. A GET workflow action appends the field value to the end of a URI and opens it in a web browser¹. A POST workflow action sends the field value as part of an HTTP request to a web server¹. You can configure a workflow action to open a web page in either the same window or a new window¹. Therefore, option D is correct, while options A, B and C are incorrect.

NEW QUESTION # 187

Which of the following describes the I transaction command?

- A. It allows an exchange of data from one Splunk system to another Splunk system.
- B. It is an SPL command that groups at least two events together based on shared values in selected fields.
- **C. It is an SPL command that groups events together with shared values in selected fields.**
- D. It allows an exchange of data from one Splunk index to another Splunk index.

Answer: C

Explanation:

The transaction command is a Splunk command that finds transactions based on events that meet various constraints .

Transactions are made up of the raw text (the `_raw` field) of each member, the time and date fields of the earliest member, as well as the union of all other fields of each member .

The transaction command groups events together by matching one or more fields that have the same value across the events . For example, `| transaction clientip` will group events that have the same value in the `clientip` field.
