Latest Terraform-Associate-003 Dumps Book - Latest Terraform-Associate-003 Exam Online

There are three different versions of our Terraform-Associate-003 preparation prep including PDF, App and PC version. Each version has the suitable place and device for customers to learn anytime, anywhere. In order to give you a basic understanding of our various versions on our Terraform-Associate-003 Exam Questions, each version offers a free trial. So there are three free demos of our Terraform-Associate-003 exam materials. And you can easily download the demos on our website.

HashiCorp Terraform-Associate-003 Exam Syllabus Topics:

Topic	Details
Topic 1	• Configure and use Terraform providers: In this section, topics covered include understanding Terraform's plugin-based architecture and configuring providers. It also covers aliasing, sourcing, and versioning functions.
Topic 2	• Create, maintain, and use Terraform modules: In this section of the exam, candidates are tested for creating a module, using a module in configuration, and topics such as refactoring an existing configuration into modules.

- Develop collaborative Terraform workflows: In this section, candidates are tested for their skills related to managing the Terraform binary, providers, and modules using version constraints and setting up remote states. It also covers the utilization of the Terraform workflow in automation.

HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Sample Questions (Q17-Q22):

NEW QUESTION # 17

What is terraform plan -refresh-only intended to detect?

- A. Terraform configuration code changes
- B. Empty state files
- C. Corrupt state files
- D. State file drift

Answer: D

Explanation:

The terraform refresh-only command is intended to detect state file drift. This command synchronizes the state file with the actual infrastructure, updating the state to reflect any changes that have occurred outside of Terraform.

From terraform plan -refresh-only:

"Use this to detect drift, i.e., changes made outside of Terraform."

It compares actual infrastructure to what's recorded in the state file.

NEW QUESTION # 18

What is a key benefit of the Terraform state file?

- A. A state file can schedule recurring infrastructure tasks
- B. A state file is a source of truth for resources provisioned with Terraform
- C. A state file is the desired state expressed by the Terraform code files
- D. A state file is a source of truth for resources provisioned with a public cloud console

Answer: B

Explanation:

This is a key benefit of the Terraform state file, as it stores and tracks the metadata and attributes of the resources that are managed by Terraform, and allows Terraform to compare the current state with the desired state expressed by your configuration files.

NEW QUESTION # 19

Which option cannot be used to keep secrets out of Terraform configuration files?

- A. A -var flag
- B. secure string
- C. Environment variables
- D. A Terraform provider

Answer: B

Explanation:

A secure string is not a valid option to keep secrets out of Terraform configuration files. A secure string is a feature of AWS Systems Manager Parameter Store that allows you to store sensitive data encrypted with a KMS key. However, Terraform does not support secure strings natively and requires a custom data source to retrieve them. The other options are valid ways to keep secrets out of Terraform configuration files. A Terraform provider can expose secrets as data sources that can be referenced in the configuration. Environment variables can be used to set values for input variables that contain secrets. A -var flag can be used to pass values for input variables that contain secrets from the command line or a file.

References = [AWS Systems Manager Parameter Store], [Terraform AWS Provider Issue #55], [Terraform Providers], [Terraform Input Variables]

NEW QUESTION # 20

Which of the following command would be use to access all of the attributes and details of a resource managed by Terraform?

- A. Terraform state show ' provider_type_name
- B. Terraform state list
- C. Terraform state list provider_type_name
- D. Terraform get provider_type_name

Answer: A

Explanation:

Explanation

This is the command that you would use to access all of the attributes and details of a resource managed by Terraform, by providing the resource address as an argument. For example, terraform state show

'aws_instance.example' will show you all the information about the AWS instance named example.

NEW QUESTION # 21

Which option cannot be used to keep secrets out of Terraform configuration files?

- A. A -var flag
- B. secure string
- C. Environment variables
- D. A Terraform provider

Answer: B

Explanation:

A secure string is not a valid option to keep secrets out of Terraform configuration files. A secure string is a feature of AWS Systems Manager Parameter Store that allows you to store sensitive data encrypted with a KMS key. However, Terraform does not support secure strings natively and requires a custom data source to retrieve them. The other options are valid ways to keep secrets out of Terraform configuration files. A Terraform provider can expose secrets as data sources that can be referenced in the configuration. Environment variables can be used to set values for input variables that contain secrets. A -var flag can be used to pass values for input variables that contain secrets from the command line or a file. References =
