VMware 3V0-21.23 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">VMware Products and Solutions: Targeting VMware Engineers, this section describes VMware Cloud Foundation architecture, its components like vSphere and NSX, benefits such as automation and scalability, and use cases like hybrid cloud environments. It assesses understanding of VMware Validated Solutions.
Topic 2	<ul style="list-style-type: none">IT Architectures, Technologies, Standards: This section of the exam measures the skills of IT Architects and covers differentiating between business and technical requirements, as well as conceptual, logical, and physical design. A key skill measured is "Designing System Availability."

Topic 3

- Plan and Design the VMware Solution: This part targets Solution Designers, evaluating their ability to gather business objectives, create conceptual models based on these objectives, develop logical designs, and translate them into physical designs that meet specific requirements like manageability or security.

VMware vSphere 8.x Advanced Design Sample Questions (Q19-Q24):

NEW QUESTION # 19

Which requirement would be classified as a functional requirement within the application design documentation?

- A. The application must be capable of handling 200 transactions per second.
- **B. Administrators must monitor the network traffic of the desired systems.**
- C. Penetration testing must be executed quarterly with a pass rate of 80% or higher.
- D. The application must be hosted with redundancy levels of N+1 or better.

Answer: B

NEW QUESTION # 20

What is the purpose of creating a vCenter Server logical design?

- A. To ensure the design meets the required industry regulations and standards.
- B. To identify the specific tasks and operations vCenter Server should perform.
- C. To determine the hardware and infrastructure requirements for vCenter Server.
- **D. To provide an abstract representation of vCenter Server's structure and components.**

Answer: D

NEW QUESTION # 21

An architect is tasked with an application migration to a new VMware Cloud platform. The application service owner assistance from the architect to identify the technical requirements of the application.

The following has been made available following initial discussions:

A VMware Aria Operations report containing current resource usage

The output from a planning session including a roadmap for planned service growth
A service dependency map from the company's IT operations management tool
The desired consolidation ratio for the target platform is 10:1
The applications hosting budget is reducing by 10%
Which two contain the technical requirements of the application? (Choose two.)

- A. The output from a planning session including a roadmap for planned service growth
- B. The applications hosting budget is reducing by 10%
- **C. The desired consolidation ratio for the target platform is 10:1**
- D. A service dependency map from the company's IT operations management tool
- **E. A VMware Aria Operations report containing current resource usage**

Answer: C,E

Explanation:

The desired consolidation ratio for the target platform is 10:1:

The consolidation ratio is a key technical requirement as it directly influences the planning for the deployment and resource allocation in the new VMware Cloud platform. It defines how many virtual machines can be consolidated per physical host in the target environment, which is critical for the sizing and resource planning.

A VMware Aria Operations report containing current resource usage:

The VMware Aria Operations report provides actual data on the current resource consumption of the application. This report is essential for understanding how much resource the application currently uses and helps in determining the necessary capacity in the target platform. This is a technical requirement since it informs resource allocation, scaling, and performance expectations.

NEW QUESTION # 22

A VMware Service Provider is tasked with delivering a solution for continuous availability for a subset of Tier 1 virtual machines

(VMs) and vApps running in their vSAN environment. The VMs make up a mission-critical application and there can be no data loss in the event of an outage at their primary data center. In the event of a regional outage, they have established a 10-minute recovery point objective (RPO). Failover/failback to the third site must be automated.

They have the following in place:

- Two local data centers (primary and secondary) connected with 100 Gb dedicated fiber
- 2ms round-trip time (RTT) latency between the sites
- A third data center located on another power grid
- 70ms latency between the primary and secondary data centers
- Matching storage arrays at all locations

Which two solutions could be used to meet the requirements- (Choose two.)

- **A. Site Recovery Manager**
- B. vSphere Data Protection
- C. Snapshots
- **D. vSAN Metro Cluster**
- E. vStorage APIs for Array Integration (VAAI)

Answer: A,D

Explanation:

Metro is a stretched-cluster, vSAN tolerates 5ms to main sites first-second and 150ms to a third site where a witness vm will stay, all details are correct till now. Matching storage arrays at all locations seems to be, or its a single datastore presented to infrastructure itself. As the third site has an infrastructure established as well can be used to replicate VMs from the stretched datastore from first-second, the need of Site Recovery.

NEW QUESTION # 23

How are SLA requirements different from performance requirements?

- A. SLA requirements specify the system's tasks, while performance requirements define the expected levels of system operation.
- B. SLA requirements focus on hardware specifications, while performance requirements focus on data storage.
- C. SLA requirements relate to client agreements, while performance requirements deal with network connectivity.
- **D. SLA requirements define expected levels of system performance and availability, while performance requirements focus on specific metrics.**

Answer: D
