Free demo for Secure-Software-Design learning materials is available, you can try before buying, so that you can have a deeper understanding of what you are going to buy. We also recommend you to have a try before buying. In addition, Secure-Software-Design training materials contain both questions and answers, and it's convenient for you to check answers after practicing. Secure-Software-Design Exam Dumps cover most of the knowledge points for the exam, and you can have a good command of the knowledge points by using Secure-Software-Design exam dumps. We have online and offline chat service, if you have any questions, you can consult us.

Many candidates said that they failed once, now try the second time but they still have no confidence, they want to know if our Secure-Software-Design braindumps PDF materials can help them clear exam 100%. We say "Yes, 100% passing rate for most exams". They would like to purchase Secure-Software-Design Braindumps Pdf materials since they understand the test cost is quite expensive and passing exam is not really easy. Why not choose Secure-Software-Design braindumps PDF materials at the beginning?

Design New Dumps Ebook

Our WGU Secure-Software-Design practice materials compiled by the most professional experts can offer you with high quality and accuracy WGU Secure Software Design (KEO1) Exam Secure-Software-Design practice materials for your success. Up to now, we have more than tens of thousands of customers around the world supporting our WGU exam torrent.

WGU Secure Software Design (KEO1) Exam Sample Questions (Q65-Q70):

NEW QUESTION # 65

A product team, consisting of a Scrum Master, a Business Analyst, two Developers, and a Quality Assurance Tester, are on a video call with the Product Owner. The team is reviewing a list of work items to determine how many they feel can be added to their backlog and completed within the next two-week iteration.

Which Scrum ceremony is the team participating in?

- A. Sprint Planning
- B. Daily Scrum
- C. Sprint Review
- D. Sprint Retrospective

Answer: A

NEW QUESTION # 66

The software security team prepared a report of necessary coding and architecture changes identified during the security assessment. Which design and development deliverable did the team prepare?

- A. Privacy implementation assessment results
- B. Security test plans
- C. Updated threat modeling artifacts
- D. Design security review

Answer: C

Explanation:

Comprehensive and Detailed In-Depth Explanation:

In the context of software security, a threat model is a structured representation that identifies potential threats to the system, evaluates their severity, and guides the development of mitigation strategies. When a security assessment reveals vulnerabilities or areas of concern, it's imperative to update the threat modeling artifacts to reflect these findings. This ensures that the threat model remains an accurate and current representation of the system's security posture.

By updating the threat modeling artifacts, the team documents the identified threats and outlines necessary coding and architectural changes to mitigate these threats. This proactive approach allows for the integration of security considerations early in the design and development phases, reducing the likelihood of vulnerabilities in the deployed system.

This practice aligns with the Design business function of the OWASP Software Assurance Maturity Model (SAMM), which emphasizes the importance of incorporating security into the software design process.

Within this function, the Threat Assessment practice focuses on identifying and evaluating potential threats to inform security requirements and design decisions. Updating threat modeling artifacts is a key activity within this practice, ensuring that security assessments directly influence the system's design and architecture.

NEW QUESTION # 67

Which secure coding best practice says to use a single application-level authorization component that will lock down the application if it cannot access its configuration information?

- A. Data protection
- B. Session management
- C. Communication security
- D. Access control

Answer: D

NEW QUESTION # 68

During fuzz testing of the new product, random values were entered into input elements Searchrequests were sent to the correct API endpoint but many of them failed on execution due to type mismatches.

How should existing security controls be adjusted to prevent this in the future?

- A. Ensure the contents of authentication cookies are encrypted
- B. Ensure all requests and responses are encrypted
- C. Ensure all user input data is validated prior to transmitting requests
- D. Ensure sensitive transactions can be traced through an audit log

Answer: C

Explanation:

Validating user input data before it is processed by the application is a fundamental security control in software design. This process, known as input validation, ensures that only properly formed data is entering the workflow of the application, thereby preventing many types of attacks, including type mismatches as mentioned in the question. By validating input data, the application can reject any requests that contain unexpected or malicious data, reducing the risk of security vulnerabilities and ensuring the integrity of the system.

* A Secure Software Development Life Cycle (SSDLC) ensures that security is considered at every phase of the development process, from planning and design to coding, testing, deploying, and maintaining the software².

NEW QUESTION # 69

Which design and development deliverable contains the results of each type of evaluation that was performed and the type and number of vulnerabilities discovered?

- A. Privacy compliance report
- B. Remediation report
- C. Security test execution report
- D. Security testing reports

Answer: D

Explanation:

Security testing reports are the deliverables that typically contain detailed results of the security evaluations performed. These reports include the types of tests conducted, such as static and dynamic analysis, penetration testing, and code reviews, as well as the number and types of vulnerabilities discovered. The purpose of these reports is to document the security posture of the software at the time of testing and to provide a basis for remediation efforts.

References: The information aligns with best practices in secure software development, which emphasize the importance of documenting security requirements and conducting risk analysis during the design phase to identify and mitigate vulnerabilities early in the SDLC¹².
