Salesforce Certified MuleSoft Integration Foundations Sample Questions (Q44-Q49):

NEW QUESTION # 44

A Kubernetes controller automatically adds another pod replica to the resource pool in response to increased application load.

- A. Vertical
- **B. Horizontal**
- C. Diagonal
- D. Down

Answer: B

Explanation:

Horizontal Scaling (Scale Out): This involves adding more instances (replicas/nodes) of a resource to handle increased load. In a Kubernetes or Runtime Fabric context, when the controller adds another "pod replica," it is strictly defined as horizontal scaling. Vertical Scaling (Scale Up): This would involve increasing the size (CPU or RAM capacity) of an existing single instance/pod, rather than adding more copies of it.

Context: MuleSoft's Runtime Fabric (RTF) runs on Kubernetes and leverages this horizontal auto-scaling capability to maintain performance under high traffic.

NEW QUESTION # 45

A system administrator needs to determine when permissions were last changed for an Anypoint Platform user.

- A. Mule Stack Traces
- B. Anypoint Studio
- **C. Audit Logging**
- D. Anypoint Monitoring

Answer: C

Explanation:

Audit Logging: This feature in Anypoint Platform provides a searchable history of actions performed within the platform. It is designed specifically for governance and security compliance.

What it tracks: It records "who did what and when." This includes changes to:

User permissions and roles (Access Management).

Environment configurations.

API Manager policies.

Why others are incorrect:

Anypoint Monitoring: Focuses on application performance (CPU, Memory, API analytics), not administrative actions.

Stack Traces: Are used for debugging runtime application errors, not auditing user permissions.

NEW QUESTION # 46

Which key DevOps practice and associated Anypoint Platform component should a MuleSoft Integration team adopt to improve delivery quality?

- A. Passive monitoring with Anypoint Monitoring
- **B. Automated testing with MUnit**
- C. Manual testing with Anypoint Studio
- D. Continuous design with API Designer

Answer: B

Explanation:

DevOps & Quality: A core tenet of DevOps is CI/CD (Continuous Integration/Continuous Delivery). To achieve high quality in a fast-paced CI/CD pipeline, testing must be automated, not manual.

MUnit: This is the native testing framework for Mule applications. It allows developers to write unit and integration tests that run automatically during the build process (e.g., via Maven).¹² Why others are incorrect:³⁴ Manual testing (B): Is slow, error-prone, and not a "DevOps" scaling practice.⁵⁶ Passive monitoring (A): happens after deployment (Operations), whereas MUnit ensures quality⁷ during development/build.

NEW QUESTION # 47

What is a core pillar of the MuleSoft Catalyst delivery approach?

- A. Technology centralization
- B. Scope reduction
- C. Process thinking
- **D. Business outcomes**

Answer: D

Explanation:

MuleSoft Catalyst Pillars: The Catalyst methodology is built on three core pillars designed to drive successful digital transformation:

Business Outcomes: Defining clear KPIs and aligning technology with business goals⁶.

Technology Delivery: The actual implementation (Anypoint Platform).

Organizational Enablement: Building the C4E and training the team.

The Answer: "Business outcomes" is the only option listed that corresponds to one of these

NEW QUESTION # 48

What is an advantage of using OAuth 2.0 client credentials and access tokens over only API keys for API authentication?

- **A. If the access token is compromised, the client credentials do not have to be reissued**

- B. If the access token is compromised, it can be exchanged for an API key
- C. If the client secret is compromised, the client credentials do not have to be reissued
- D. If the client ID is compromised, it can be exchanged for an API key

Answer: A

Explanation:

Security Mechanisms:

API Keys (Client ID/Secret): These are static, long-lived credentials. If a Client Secret is stolen, you must reset it, update the application code, and redeploy-a painful process.

OAuth 2.0 (Access Tokens): The client uses the ID/Secret to request a temporary Access Token (TTL of usually 15-60 minutes).

The Advantage: The API client sends the token (not the secret) in the header. If this token is intercepted/compromised, it will expire shortly. The attacker cannot generate new tokens without the original Client Secret. Therefore, the underlying credentials remain safe, and you do not need to reissue them.
