Pure Storage Pure Certified Portworx Enterprise Professional (PEP) Exam Sample Questions (Q29-Q34):

NEW QUESTION # 29

An application team is preparing to deploy an ElasticSearch application and wants all Portworx volumes created in 6 specific Kubernetes nodes.

Which Portworx feature should they use to achieve this?

- A. Autopilot
- B. Stork
- **C. Volume placement strategy**

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To ensure Portworx volumes for an ElasticSearch application are created only on specific Kubernetes nodes, the Volume Placement Strategy feature is used. This feature allows administrators to define node affinity or anti-affinity rules that restrict volume provisioning to a subset of nodes. By tagging the six nodes with appropriate labels and configuring the StorageClass or volume parameters to respect these labels, Portworx guarantees that volumes will only be provisioned on those nodes. This targeted volume placement is critical for performance optimization, data locality, and compliance with infrastructure constraints. Autopilot automates scaling and Stork manages storage-aware scheduling but does not directly control volume node placement. The Portworx deployment documentation highlights Volume Placement Strategy as the tool for precise volume-to-node mapping in Kubernetes clusters **【Pure Storage Portworx Deployment Guide source】** .

NEW QUESTION # 30

An administrator wants to check the size, availability, and usage of all pools in the cluster.

Which command should the administrator use?

- **A. pxctl service pool show**
- B. kubectl get storagecluster
- C. pxctl cluster provision-status

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To view detailed information about storage pools in a Portworx cluster-including size, availability, usage, and health-administrators should use the command `pxctl service pool show`. This CLI command provides a comprehensive overview of all storage pools configured on cluster nodes, including pool IDs, device names, pool sizes, free space, and status. It helps administrators monitor resource utilization, detect degraded pools, and plan capacity expansions. While `kubectl get storagecluster` shows the overall cluster CRD status and `pxctl cluster provision-status` shows provisioning status, neither provides detailed pool-level insights. Portworx's operational documentation recommends `pxctl service pool show` as the definitive command for monitoring pool resources and ensuring storage health across the cluster **【Pure Storage Portworx CLI Guide source】** .

NEW QUESTION # 31

What is a key benefit of using on-demand snapshots in a Kubernetes environment with Portworx?

- A. They require no additional configuration after the initial setup.
- **B. They provide immediate data recovery options without stopping applications.**
- C. They automatically scale storage capacity.

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

On-demand snapshots in Portworx allow administrators and applications to create point-in-time copies of volumes instantly without requiring downtime or interrupting running workloads. This capability is critical in Kubernetes environments where high availability and continuous operation are mandatory. Snapshots capture the exact state of data at a moment, enabling rapid recovery from accidental deletion, corruption, or ransomware attacks. Since these snapshots are created live, applications continue to run seamlessly, ensuring minimal impact on user experience. Portworx's snapshot technology uses efficient -on-write mechanisms, which also minimize storage overhead. Official Portworx documentation emphasizes that on-demand snapshots enhance data protection strategies by enabling quick backups and restores without requiring maintenance windows or complex scheduling **【Pure Storage Portworx Snapshot Guide source】** .

NEW QUESTION # 32

What information is included in the Portworx diagnostics bundle (diags)?

- **A. Portworx journal logs, CLI command outputs, and basic OS information**
- B. User activity logs, security policies, and firewall rules
- C. Application logs, Kubernetes events, and network configurations

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The Portworx diagnostics bundle, known as "diags," aggregates comprehensive diagnostic data for troubleshooting. This includes Portworx journal logs, which record detailed system and service events essential for identifying errors or malfunctions. Additionally, the bundle contains outputs from key CLI commands such as `pxctl status` and `pxctl volume list` that provide snapshots of the cluster's health, volume states, and configuration at the time of collection. Basic operating system information, including kernel version, disk hardware details, and network interfaces, is also captured to understand the underlying environment. Together, these components equip Portworx support and administrators with the contextual data needed for effective root cause analysis and faster issue resolution. The official Portworx support documentation recommends collecting and submitting this bundle for all significant troubleshooting cases as it expedites problem diagnosis and resolution **【Pure Storage Portworx Support Guide source】** .

NEW QUESTION # 33

Which command shows a summary of the Portworx cluster status?

- **A. pxctl cluster status**
- B. `kubectl get pxstatus`
- C. `helm list --px`

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The command `pxctl cluster status` provides a concise summary of the Portworx cluster's health and operational status. This includes node states, storage pool information, volume statuses, and quorum information. It is the primary CLI command for administrators to quickly assess cluster health and detect any issues affecting storage availability or performance. `helm list --px` is a Helm package management command unrelated to cluster status, and `kubectl get pxstatus` is not a valid Kubernetes or Portworx command. Portworx documentation recommends `pxctl cluster status` as an essential monitoring command during routine operations and troubleshooting to ensure the cluster is functioning properly and that all nodes are communicating and healthy **【Pure Storage Portworx CLI Guide source】**
