Fortinet EMEA Advanced Support Exam Sample Questions (Q10-Q15):

NEW QUESTION # 10

Hybrid cloud means that

- A. The cloud provider uses AMD, Intel and possibly also other CPU vendors
- **B. Some of the customer's systems are virtualized in the public cloud and some are in the local datacenter**
- C. Cloud provider provides both 32-bit and 64-bit virtual machines
- D. One customer uses VMs with multiple different operating systems in the same cloud account

Answer: B

Explanation:

A hybrid cloud combines on-premises infrastructure (local datacenter) with public cloud resources, allowing workloads to operate across both environments for flexibility and scalability. Fortinet solutions like FortiGate- VM support hybrid cloud deployments. Option A refers to hardware diversity, C to OS variety, and D to architecture types, none of which define hybrid cloud. Exact extract: "Hybrid cloud is the combination of public cloud services with an on-premises private cloud or datacenter... This allows customers to run some systems in the public cloud and others in their local datacenter, managed seamlessly."

NEW QUESTION # 11

Which FortiGate feature supports load balancing across multiple WAN links?

- A. Virtual Routing
- B. Link Aggregation
- C. Multi-Path Routing
- **D. SD-WAN**

Answer: D

Explanation:

FortiGate's SD-WAN feature enables load balancing and intelligent traffic steering across multiple WAN links based on criteria like bandwidth, latency, or application. Link Aggregation (B) bonds interfaces, Virtual Routing (C) is VRF, and Multi-Path Routing (D) is not a standard term. Exact extract: "SD-WAN enables load balancing and traffic steering across multiple WAN links, optimizing performance and reliability based on configured rules and metrics."

NEW QUESTION # 12

In Active FTP who sends the PORT command?

- **A. The FTP Client**
- B. Both
- C. There is no PORT command in Active FTP
- D. The FTP Server

Answer: A

Explanation:

In Active FTP, the client sends the PORT command to the server, specifying an ephemeral port for the server to initiate the data connection back to the client. This distinguishes Active FTP from Passive FTP, where the server provides the port. The server does not send PORT, and the command is a key part of Active FTP. Exact extract: "In Active FTP, the client sends a PORT command to the server, specifying the IP address and port number for the data connection... The server then initiates the data connection to the client's specified port."

NEW QUESTION # 13

What happens when a router receives a packet for forwarding with a TTL value of 1?

- A. It increments it and passes it on to the next router
- **B. The TTL is decreased to 0, the packet is dropped and an ICMP message is sent to the transmitting IP**
- C. The packet is only forwarded through the router to a locally attached network
- D. It decreases the value to 0 and then forwards it

Answer: B

Explanation:

When a router, such as a FortiGate, receives a packet with a TTL (Time to Live) of 1, it decrements the TTL to 0, drops the packet, and sends an ICMP Time Exceeded message to the source IP. This prevents infinite loops in routing. Option A is incorrect as TTL is decremented, not incremented; B and D are incorrect as the packet is not forwarded when TTL reaches 0. Exact extract: "When a packet's TTL reaches 1, the router decrements it to 0, drops the packet, and sends an ICMP Time Exceeded message to the source IP address to prevent routing loops."

NEW QUESTION # 14

How does a stateful firewall control a TCP session?

- **A. TCP sequence numbers and TCP flags are used to control the session**
- B. TCP destination ports are used to control the session
- C. TCP ack numbers are used to control the session
- D. TCP source ports are used to control the session

Answer: A

Explanation:

A stateful firewall, like FortiGate, tracks TCP sessions by maintaining a state table that includes TCP sequence numbers and flags (e.g., SYN, ACK, FIN) to monitor the connection's lifecycle (establishment, data transfer, termination). This ensures proper session handling, detecting out-of-order packets or invalid states.

Source and destination ports identify the session but don't control its state, and ACK numbers alone are insufficient. Exact extract: "Stateful inspection tracks TCP sessions using sequence numbers and TCP flags (SYN, ACK, FIN, etc.) to ensure packets are valid and part of an established session... FortiGate maintains a state table to monitor the TCP connection states."
