Candidates can take advantage of the free trials to evaluate the quality and standard of the 156-587 Dumps before making a purchase. With the right Check Point Certified Troubleshooting Expert - R81.20 (156-587) study material and support team passing the examination at first attempt is an achievable goal.

CheckPoint Check Point Certified Troubleshooting Expert - R81.20 Sample Questions (Q88-Q93):

NEW QUESTION # 88
Your users have some issues connecting with Mobile Access VPN to your gateway. How can you debug the tunnel establishment?

- A. in the file SCVPNDIR/conf/httpd conf change the line Loglevel To LogLevel debug and run cvpnrestart
- B. run vpn debug truncon
- C. in the file $VPNDIR/conf/httpd conf change the line Loglevel To LogLevel debug and run vpn restart
- D. run fw ctl zdebug -m sslvpn all

Answer: A

NEW QUESTION # 89
What command is used to find out which port Multi-Portal has assigned to the Mobile Access Portal?

- A. mpclient getdata mobi
- B. netstat getdata sslvpn
- C. mpcient getdata sslvpn
- D. netstat -nap | grep mobile

Answer: C

NEW QUESTION # 90
In some scenarios it is very helpful to use advanced Linux commands for troubleshooting purposes. Which command displays information about resource utilization for running processes and shows additional information for core utilization and memory?

- A. top
- B. cptop
- C. vmstat
- D. mpstat

Answer: A

Explanation:
The top command is a Linux command that displays information about resource utilization for running processes and shows additional information for core utilization and memory. The top command provides a dynamic real-time view of the system, showing the processes that are consuming the most CPU, memory, and other resources. The top command also shows the total number of processes, the system load average, the uptime, and the CPU usage by user, system, and idle. The top command can be customized by using various options and interactive commands to change the display, sort the processes, filter the output, and kill processes. The other commands are incorrect because:
* B. vmstat is a Linux command that displays information about the virtual memory, CPU, disk, and system activity. It does not show information about individual processes or core utilization.
* C. cptop is a Check Point command that displays information about the firewall kernel activity, such as the number of connections, packets, drops, and rejects. It does not show information about other processes or memory usage.
* D. mpstat is a Linux command that displays information about the CPU utilization by each processor or core. It does not show information about processes or memory usage.

* vmstat(8) - Linux manual page
* cptop - Check Point Software
* mpstat(1) - Linux manual page

NEW QUESTION # 91

If SmartLog is not active or failed to parse results from server, what commands can be run to re-enable the service?

- A. smartloginit and smartlogstop
- B. smartlogstart and smartlogsetup
- C. smartlogstart and smartlogstop
- D. smartlogrestart and smartlogstart

Answer: D

Explanation:

The correct answer is A. smartlogrestart and smartlogstart. These commands are used to restart the SmartLog service and start the SmartLog indexing process. They can be run on the Security Management Server or the Log Server to resolve issues with SmartLog not being active or failing to parse results from the server. The other commands are not valid or relevant for this purpose.

NEW QUESTION # 92

Your users are having trouble opening a Web page and you need to troubleshoot it. You open the Smart Console, and you get the following message when you navigate to the Logs and Monitor "SmartLog is not active or Failed to parse results from server". What is the first thing you can try to resolve it?

- A. smartlog debug on and smartlog debug off
- B. cpmstop and cpmstart
- C. smartlog_server restart
- D. Run the commands on the SMS: smartlogstart and smartlogstop

Answer: C

Explanation:

The error message "SmartLog is not active or Failed to parse results from server" indicates that there is a problem with the SmartLog server process, which is responsible for indexing and querying the logs. One possible cause of this problem is a corrupted log file or a mismatched IP address in the logging configuration files. Another possible cause is a communication failure between the SmartLog server and the CPM process or the SmartConsole client. To resolve this issue, the first thing to try is to restart the SmartLog server process by running the command smartlog_server restart on the Security Management Server or the Log Server. This command will stop the SmartLog server, clean the buffer, and start it again. This may fix the corrupted log file or the communication issue. If the problem persists, other steps may be needed, such as checking the network connectivity, the firewall rules, the logging configuration files, the CPM process, or the SmartConsole client.
