WGU Managing Cloud Security (JY02) Sample Questions (Q21-Q26):

NEW QUESTION # 21
Which phase of software design covers the combination of individual components of developed code and the determination of proper interoperability?

- A. Planning
- B. Testing
- C. Training

- D. Coding

Answer: B

Explanation:
The phase of software design that integrates individual code components and verifies their interoperability is Testing, specifically integration testing. After developers write and unit-test individual modules, those modules must be combined into a complete system. The testing phase ensures that these modules communicate properly, data flows correctly, and overall functionality meets requirements.

Planning establishes project goals, coding builds individual components, and training prepares users. None of these directly verify interoperability. Testing is critical because even well-functioning components may fail when combined, due to interface mismatches, unexpected data structures, or dependency issues.

Cloud-based systems often integrate microservices, APIs, and third-party services. Testing validates that these distributed components interact seamlessly. Proper testing reduces defects, supports reliability, and ensures a consistent end-user experience. It also aligns with DevOps practices, where continuous integration and automated testing pipelines quickly identify and remediate interoperability issues.

NEW QUESTION # 22
What is the process of identifying and procuring stored data as evidence for legal purposes?

- A. Chain of custody
- B. Forensic imaging
- C. Electronic discovery
- D. Gap analysis

Answer: C

Explanation:
The correct answer iselectronic discovery (e-discovery). This process involves identifying, collecting, and producing electronically stored information (ESI) that may serve as evidence in legal proceedings. E- discovery ensures that relevant data such as emails, logs, or documents is preserved and made available in a legally defensible manner.

Chain of custody refers to documenting the handling of evidence once collected, while forensic imaging creates exact copies of digital media. Gap analysis identifies weaknesses in processes but is unrelated to evidence collection.

E-discovery is essential in both corporate and cloud contexts, as data is often distributed across multiple environments. Cloud providers may assist customers with e-discovery by providing tools for searching, tagging, and exporting relevant data. A sound e-discovery process ensures compliance with legal obligations and prevents spoliation of evidence.

NEW QUESTION # 23
An organization is implementing a new hybrid cloud deployment and wants all employees to provide a username, password, and security token before accessing any of the cloud resources. Which type of security control is the organization leveraging for its employees?

- A. Authentication
- B. Web application firewall (WAF)
- C. Access control list (ACL)
- D. Authorization

Answer: A

Explanation:
The requirement for a username, password, and security token describesauthentication-the process of verifying the identity of a user. By requiring multiple factors (something you know + something you have), the organization is implementing multifactor authentication (MFA).

Authorization defines what resources a user can access after authentication. WAFs protect web applications, and ACLs specify rules for allowed or denied traffic, but neither validate user identity.

Authentication ensures that only legitimate users gain access to cloud resources. In hybrid environments, MFA is a strong safeguard against credential theft and phishing attacks, providing assurance that identities are genuine before authorization decisions are made.

NEW QUESTION # 24

Which business area in the enterprise risk management (ERM) strategy is concerned with formal risk assessments when forming new or renewing existing vendor relationships?

- A. Quality assurance
- B. Marketing
- C. Procurement
- D. Software development

Answer: C

Explanation:

Theprocurementfunction is directly responsible for vendor selection and contract management, including risk assessments of new or renewed vendor relationships. This ensures that third-party providers meet security, compliance, and performance requirements. Software development and quality assurance focus on product creation and validation. Marketing manages branding and outreach. None of these directly involve evaluating external vendor risk.

Procurement integrates due diligence, contract clauses, and performance monitoring into enterprise risk management. This reduces exposure to third-party threats and ensures compliance with frameworks such as ISO 27036 (supplier relationships) and NIST vendor risk management guidelines.

NEW QUESTION # 25

An organization that primarily uses a remote work model is reviewing the documentation of various insurance providers to become eligible for cybersecurity insurance. Competitive insurance providers require the organization to implement security controls to ensure only authorized personnel can access the network, data, emails, and other administrative information. Which commonly required control should the organization implement before applying for cybersecurity insurance from these competitive insurance providers?

- A. Multifactor authentication (MFA)
- B. Application whitelisting
- C. Network segmentation
- D. Trusted platform module (TPM)

Answer: A

Explanation:

Multifactor Authentication (MFA)is a commonly mandated control for obtaining cybersecurity insurance.

MFA requires users to present at least two independent factors-something they know (password), something they have (token), or something they are (biometrics). This significantly reduces the risk of unauthorized access due to stolen or weak credentials.

Network segmentation and application whitelisting are valuable, but they are not universal insurance requirements. TPM is a hardware component for securing local devices but does not protect remote access in distributed work models.

By enforcing MFA across VPNs, cloud services, email, and administrative interfaces, organizations demonstrate strong access control measures. Insurance providers recognize MFA as a foundational safeguard, reducing claims risk from credential-based breaches. This makes MFA both a compliance requirement and a best practice.
