Get Fantastic AZ-400 Hottest Certification and Pass Exam in First Attempt

Dumpkiller offers you the best practice tests for the preparation of AZ-400 exams. The practice tests are designed to provide you the type of questions you are going to face in real AZ-400 exams. The “simulated” real AZ-400 exam scenario, created in the practice exam software, is meant to make you familiar with the actual AZ-400 Exam. AZ-400 announce several changes. Through one year, in their AZ-400 exams according to the updated technologies. Make sure to purchase the most recent and updated version of AZ-400 certification practice exam for best preparation of AZ-400 exam.

Microsoft Designing and Implementing Microsoft DevOps Solutions Sample Questions (Q198-Q203):

NEW QUESTION # 198

You are developing a full Microsoft .NET Framework solution that includes unit tests.

You need to configure SonarQube to perform a code quality validation of the C# code as part of the build pipelines.

Which four tasks should you perform in sequence? To answer, move the appropriate tasks from the list of tasks to the answer area and arrange them in the correct order.

Actions Commands Cmdlets Statements	Answer Area
Run Code Analysis	 Microsoft dumpkiller.com
Visual Studio Test	
Publish Build Artifacts	
Visual Studio Build	
Prepare Analysis Configuration	

Answer:

Explanation:

Actions Commands Cmdlets Statements	Answer Area
Run Code Analysis	 Microsoft dumpkiller.com
Visual Studio Test	
Publish Build Artifacts	
Visual Studio Build	
Prepare Analysis Configuration	

Prepare Analysis Configuration
Visual Studio Build
Visual Studio Test
Run Code Analysis

Explanation:

Prepare Analysis Configuration
Visual Studio Build
Visual Studio Test
Run Code Analysis

Step 1: Prepare Analysis Configuration

Prepare Analysis Configuration task, to configure all the required settings before executing the build.

This task is mandatory.

In case of .NET solutions or Java projects, it helps to integrate seamlessly with MSBuild, Maven and Gradle tasks.

Step 2: Visual Studio Build

Reorder the tasks to respect the following order:

Prepare Analysis Configuration task before any MSBuild or Visual Studio Build task.

Step 3: Visual Studio Test

Reorder the tasks to respect the following order:

Run Code Analysis task after the Visual Studio Test task.

Step 4: Run Code Analysis

Run Code Analysis task, to actually execute the analysis of the source code.

This task is not required for Maven or Gradle projects, because scanner will be run as part of the Maven/Gradle build.

Note:

NEW QUESTION # 199

Your company has an Azure subscription.

The company requires that all resource group in the subscription have a tag named organization set to a value of Contoso.

You need to implement a policy to meet the tagging requirement.

How should you complete the policy? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

```
{
  "policyRule": {
    "if": {
      "allOf": [
        {
          "field": "type",
          "equals":
          ,
          {
            "MicrosoftResources/deployments"
            "MicrosoftResources/subscriptions"
            "MicrosoftResources/subscriptions/resourceGroups"
          }
        }
      ],
      "not": {
        "field": "tags['organization']",
        "equals": "Contoso"
      }
    }
  },
  "then": {
    "effect":
    "details": [
      {
        "field": "tags['organization']",
        "value": "Contoso"
      }
    ]
  }
}
```

Answer:

Explanation:

```
{
  "policyRule": {
    "if": {
      "allOf": [
        {
          "field": "type",
          "equals":
          [
            "MicrosoftResources/deployments",
            "MicrosoftResources/subscriptions",
            "MicrosoftResources/subscriptions/resourceGroups"
          ]
        },
        {
          "not": {
            "field": "tags['organization']",
            "equals": "Contoso"
          }
        }
      ]
    },
    "then": {
      "effect":
      [
        "Append",
        "Deny",
        "DeployIfNotExists"
      ],
      "details": [
        {
          "field": "tags['organization']",
          "value": "Contoso"
        }
      ]
    }
  }
}
```

Explanation

NEW QUESTION # 200

You company uses Azure DevOps to deploy infrastructures to Azure.

Pipelines are developed by using YAML.

You execute a pipeline and receive the results in the web portal for Azure Pipelines as shown in the following exhibit.

The screenshot shows the Azure DevOps web portal. On the left is a navigation sidebar with options like Overview, Boards, Repos, Pipelines, Environments, Releases, Library, Task groups, Deployment groups, WhiteSource Bolt, Test Plans, and Artifacts. The main area displays a pipeline run for 'Fast Track' with job ID #20191120.1. The pipeline structure is as follows:

- build_vm
 - initialize build (7s)
 - Initialize job (<1s)
 - Checkout (4s)
 - CmdLine (2s)
 - Post-job: Ccheckout (<1s)
 - Finalize Job (<1s)
 - deploy_to_dev
 - deploy_to_dev_server (2s)
 - deploy_to_uat
 - deploy_to_uat_server (2s)
 - Finalize build
 - Report build status (<1s)

An expanded view of the 'initial_build' stage is shown on the right, listing the following parameters:

- 1 Pool: Azure Pipelines
- 2 Image: Ubuntu-18.04
- 3 Agent: Hosted Agent
- 4 Started: Just now
- 5 Duration: 7s
- 6
- 7 Job preparation parameters

Use the drop-down menus to select the answer choice that completes each statement based on the information presented in the graphic.

NOTE: Each correct selection is worth one point.

The pipeline contains ▼

one stage

two stages

three stages

four stages

five stages

Build_vm contains ▼

one job

two jobs

three jobs

four jobs

five jobs

Answer:

Explanation:

The pipeline contains

	▼
one stage	
two stages	
three stages	
four stages	
five stages	

Build_vm contains

	▼
one job	
two jobs	
three jobs	
four jobs	
five jobs	

Explanation

The pipeline contains		▼
	one stage	
	two stages	
	three stages	
	four stages	
	five stages	
Build_vm contains		▼
	one job	
	two jobs	
	three jobs	
	four jobs	
	five jobs

NEW QUESTION # 201

You need to find and isolate shared code. The shared code will be maintained in a series of packages.

Which three actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Actions

- Group the related components.
- Assign ownership to each component group.
- Create a dependency graph for the application.
- Identify the most common language used.
- Rewrite the components in the most common language.

Answer Area

Answer:

Explanation:

Actions

- Group the related components.
- Assign ownership to each component group.
- Create a dependency graph for the application.
- Identify the most common language used.
- Rewrite the components in the most common language.

Answer Area

- Create a dependency graph for the application.
- Group the related components.
- Assign ownership to each component group.

Explanation

Create a dependency graph for the application.

Group the related components.

Assign ownership to each component group.

Step 1: Create a dependency graph for the application

By linking work items and other objects, you can track related work, dependencies, and changes made over time. All links are defined with a specific link type. For example, you can use Parent/Child links to link work items to support a hierarchical tree structure. Whereas, the Commit and Branch link types support links between work items and commits and branches, respectively.

Step 2: Group the related components.

Packages enable you to share code across your organization: you can compose a large product, develop multiple products based on a common shared framework, or create and share reusable components and libraries.

Step 3: Assign ownership to each component graph

References:

<https://docs.microsoft.com/en-us/azure/devops/boards/queries/link-work-items-support-traceability?view=azure->

<https://docs.microsoft.com/en-us/visualstudio/releases/notes/tfs2017-relnotes>

NEW QUESTION # 202

You plan to create an image that will contain a .NET Core application.

You have a Dockerfile file that contains the following code. (Line numbers are included for reference only.)

```
01 FROM microsoft/dotnet:2.1-sdk
02 COPY ./
03 RUN dotnet publish -c Release -o out
04 FROM microsoft/dotnet:2.1-sdk
05 COPY -from=0 /out /
06 WORKDIR /
07 ENTRYPOINT ["dotnet", "appl.dll"]
```

You need to ensure that the image is as small as possible when the image is built. Which line should you modify in the file?

- A. 0
- B. 1
- C. 2
- **D. 3**

Answer: D

Explanation:

Explanation

Multi-stage builds (in Docker 17.05 or higher) allow you to drastically reduce the size of your final image, without struggling to reduce the number of intermediate layers and files.

With multi-stage builds, you use multiple FROM statements in your Dockerfile. Each FROM instruction can use a different base, and each of them begins a new stage of the build. You can selectively copy artifacts from one stage to another, leaving behind everything you don't want in the final image.
