Answer: B

NEW QUESTION # 51

In HUAWEI CLOUD Stack, which of the following scenarios can Virtual Private Network (VPN) be used?

- A. Financial transaction systems with high requirements on network latency
- B. Low-cost interconnection between VPCs across regions
- C. Temporary connection between local IDCs and Virtual Private Clouds (VPCs)
- D. Access to cloud resources on the headquarters cloud from a branch

Answer: C,D

Explanation:

The correct answers are B and D. Huawei's VPN documentation describes VPN as a way to establish an encrypted communication channel between a VPC and an external network such as a local data center.

This makes VPN suitable for a temporary or cost-sensitive connection between a local IDC and a VPC, so B is correct.

Huawei materials about hybrid-cloud and enterprise connectivity also describe VPN as a way for enterprise sites or private-cloud resources to access cloud services securely. That aligns well with a branch accessing cloud resources on the headquarters cloud, making D a valid VPN scenario.

Option C is not appropriate because Huawei typically positions dedicated/private line connectivity rather than Internet-based VPN for scenarios with high network-latency requirements, such as financial transaction systems. Option A is also not the standard answer in Huawei Cloud Stack service design, because cross-region VPC interconnection is typically handled with other networking constructs rather than ordinary site-to-cloud VPN as the primary recommended model. Therefore, the best verified answer is B, D.
