CrowdStrike Certified SIEM Engineer Sample Questions (Q21-Q26):

NEW QUESTION # 21

A parser needs to preserve the original third-party field name and also map it to an ECS-compatible field. What is the best approach?

- A. Rename the original field to the ECS field
- B. Store both values only in @rawstring
- C. Delete the original field after mapping
- D. Keep the original Vendor field and assign its value to a new ECS field

Answer: D

Explanation:

A CPS-compliant approach keeps the original Vendor field while also assigning the value to a normalized ECS field. This preserves source fidelity and enables standardized search and detections. Renaming away the original field loses source context, and storing only in @rawstring prevents structured analysis.

NEW QUESTION # 22

You want a consistent view of events from various data sources.

Which ECS field type should you normalize?

- A. Base Fields
- B. Detection Fields
- C. Core Fields
- D. Extended Fields

Answer: C

Explanation:

Elastic's official ECS guidelines define Core fields as the fields most common across use cases and explicitly state that analysis content built on these fields should work properly on data from any relevant source. They also say to focus on populating these fields first. CrowdStrike's CPS builds on ECS and is intended to standardize field names and structures across different data sources for consistent searching and analysis.

Together, that makes Core fields the right answer when your goal is a consistent cross-source view.

Why the other options are incorrect:

* Extended fields are useful, but ECS defines them as anything not in the core set, so they are not the primary normalization target for broad consistency.

* Base fields and Detection fields are not the correct ECS field-type answer to this question as framed.

NEW QUESTION # 23

You want a Next-Gen SIEM dashboard to update automatically when new data is available.

Which action would you take?

- A. Toggle the "Live" button to on
- B. Change the "Start Time" interval to 1 hour
- C. Change the "Fixed Time Range" to the current date
- D. Change the "Relative Time Range" interval to 1 millisecond ago

Answer: A

NEW QUESTION # 24

Which function is most appropriate for extracting fields from logs formatted as key=value pairs?

- A. parseJson()
- B. kvParse()
- C. parseCsv()
- D. parseXml()

Answer: B

Explanation:

kvParse() is designed for logs that use key=value structure. It extracts the keys and values into searchable fields. parseJson() is for JSON objects, parseCsv() is for delimited positional records, and parseXml() is for XML-formatted content.

NEW QUESTION # 25

What dashboard presents a view of third-party data ingestion over the past 30 days?

- A. Next-Gen SIEM Connector Dashboard

- B. Sensor Usage Dashboard
- C. Sensor Subscription Dashboard
- D. Falcon Flex Dashboard

Answer: A

Explanation:

The correct answer is D. Next-Gen SIEM Connector Dashboard .

CrowdStrike describes the Falcon Next-Gen SIEM Connector Dashboard as the place to understand the status and volume of data ingestion for third-party sources. This matches the question's requirement for a dashboard showing third-party ingestion visibility.

The other options are not aimed at third-party SIEM connector ingestion monitoring:

* Sensor Usage Dashboard relates to Falcon sensor usage, not connector-based third-party ingestion.

* Sensor Subscription Dashboard is about licensing/subscription counts.

* Falcon Flex Dashboard is related to subscription consumption and commercial usage, not connector ingestion telemetry.
