## Huawei HCIP-AI-EI Developer V2.5 Sample Questions (Q61-Q66):

### NEW QUESTION # 61

Which audio file formats can Huawei Cloud text-to-speech (TTS) generate?

- A. AAC
- B. MP3
- C. PCM
- D. WAV

**Answer: B,C,D**

Explanation:

Huawei Cloud's TTS service supports generating synthesized speech in multiple formats to meet different application requirements:

- \* WAV:High-quality, uncompressed audio format.
- \* MP3:Compressed format for efficient storage and streaming.
- \* PCM:Raw, uncompressed audio data for low-level processing.

AAC is a common format but isnotsupported by Huawei Cloud TTS as per the official specification for HCIP- AI EI Developer V2.5.

Exact Extract from HCIP-AI EI Developer V2.5:

"Huawei Cloud TTS supports output in WAV, MP3, and PCM formats to balance audio quality and storage requirements."

### NEW QUESTION # 62

In the field of deep learning, which of the following activation functions has a derivative not greater than 0.5?

- A. Tanh
- B. SeLU
- C. ReLU
- D. Sigmoid

**Answer: D**

Explanation:

The sigmoid activation function maps inputs to the range (0, 1) and has a maximum derivative of 0.25 at  $x=0$ .

This derivative value is always  $\leq 0.25$ , making it the correct choice here. While sigmoid is historically used in neural networks, it suffers from the vanishing gradient problem for large positive or negative inputs due to its small derivative values. Other functions such as ReLU, Tanh, and SeLU have different derivative behaviors, with ReLU having a derivative of 1 for positive inputs, Tanh having derivatives up to 1, and SeLU designed for self-normalizing networks with derivatives potentially greater than 0.5.

Exact Extract from HCIP-AI EI Developer V2.5:

"Sigmoid compresses values into the (0,1) range, with its maximum derivative being 0.25, which is always less than 0.5."

### NEW QUESTION # 63

Which of the following is not an algorithm for training word vectors?

- A. Word2Vec
- B. TextCNN
- C. FastText
- D. BERT

**Answer: B**

Explanation:

\* Word2Vec and FastText are neural network-based algorithms designed for generating dense vector representations of words.

\* BERT is a transformer-based language model that also generates contextualized word embeddings.

\* TextCNN, however, is a text classification model, not a word vector training algorithm. It uses convolutional neural networks to extract features from already vectorized text but does not learn static word embeddings in the same sense as Word2Vec or FastText.

Exact Extract from HCIP-AI EI Developer V2.5:

"Word2Vec, FastText, and BERT can be used to train word embeddings. TextCNN is a classification model that uses embeddings but does not train them as its primary function." Reference:HCIP-AI EI Developer V2.5 Official Study Guide - Chapter: Word Vector Representation

#### NEW QUESTION # 64

What are the adjacency relationships between two pixels whose coordinates are (21,13) and (22,12)?

- A. 8-adjacency
- B. 4-adjacency
- C. No adjacency relationship
- D. Diagonal adjacency

**Answer: A,D**

Explanation:

Pixel adjacency describes how pixels are connected:

\* 4-adjacency:Pixels share a side (up, down, left, right).

\* Diagonal adjacency:Pixels touch at a corner.

\* 8-adjacency:Combination of 4-adjacency and diagonal adjacency.

Given coordinates (21,13) and (22,12), the pixels differ by 1 in both x and y directions, meaning they meet at a corner - this is diagonal adjacency. Since 8-adjacency includes both side and diagonal adjacency, they are also 8-adjacent.

Exact Extract from HCIP-AI EI Developer V2.5:

"In 8-adjacency, pixels are considered neighbors if they are connected horizontally, vertically, or diagonally.

Diagonal adjacency occurs when pixels touch at a corner."

#### NEW QUESTION # 65

The image saturation can be enhanced by processing the \_\_\_\_\_ component of the HSV color space. (Enter H, S, or V.)

**Answer:**

Explanation:

S

Explanation:

In the HSV (Hue, Saturation, Value) color model:

\* H represents hue (color type).

\* S represents saturation (color intensity or vividness).

\* V represents brightness.

To enhance saturation in an image, adjustments are made to the S component. Increasing S increases the color vividness, making the image appear more vibrant, while reducing S moves colors toward grayscale. This approach is widely used in image enhancement tasks, especially in object recognition and segmentation, where vivid colors improve feature contrast.

Exact Extract from HCIP-AI EI Developer V2.5:

"In HSV color space, saturation (S) describes the vividness of colors. Increasing the S value enhances saturation, making colors more intense, while decreasing it makes them closer to gray." Reference:HCIP-AI EI Developer V2.5 Official Study Guide -
