Memorizing these HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Terraform-Associate-003 valid dumps will help you easily attempt the HashiCorp Terraform-Associate-003 exam within the allocated time. Thousands of aspirants have passed their HashiCorp Terraform-Associate-003 Exam, and they all got help from our HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Terraform-Associate-003 updated exam dumps. For successful preparation, you can also rely on Terraform-Associate-003 real questions.

HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Sample Questions (Q18-Q23):

NEW QUESTION # 18

terraform validate reports syntax check errors for which of the following?

- A. None of the above
- B. Code contains tabs for indentation instead of spaces
- C. The state file does not match the current infrastructure
- D. There is a missing value for a variable

Answer: A

Explanation:

The terraform validate command is used to check for syntax errors and internal consistency within Terraform configurations, such as whether all required arguments are specified. It does not check for indentation styles, missing variable values (as variables might not be defined at validation time), or state file consistency with the current infrastructure. Therefore, none of the provided options are correct in the context of what terraform validate reports.

References = Terraform's official documentation details the purpose and function of the terraform validate command, specifying that it focuses on syntax and consistency checks within Terraform configurations themselves, not on external factors like the state file or infrastructure state. Direct references from the HashiCorp Terraform Associate (003) study materials to this specific detail were not found in the provided files.

NEW QUESTION # 19

A resource block is shown in the Exhibit section of this page. How would you reference the attribute name of this resource in HCL?

- A. data.kubernetes.namespace.name
- **B. kubernetes_namespace.example.name**
- C. resource.kubernetes_namespace.example.name
- D. kubernetes_namespace.test.name

Answer: B

Explanation:

In Terraform, the correct way to reference a resource attribute is:

```
pgsql
```

```
CopyEdit
```

```
resource_type.resource_name.attribute
```

For example, if the resource block is:

```
hcl
```

```
CopyEdit
```

```
resource "kubernetes_namespace" "example" {  
  metadata {  
    name = "my-namespace"  
  }  
}
```

To reference the name attribute, use:

```
pgsql
```

```
CopyEdit
```

```
kubernetes_namespace.example.name
```

Explanation of incorrect answers:

* A (resource.kubernetes_namespace.example.name)- Incorrect. Terraform does not use the resource prefix when referencing resources.

* C (data.kubernetes.namespace.name)- Incorrect. This syntax is used for data sources, not resources.

* D (kubernetes_namespace.test.name)- Incorrect. The resource name is "example", not "test".

NEW QUESTION # 20

What is the best practice when making changes to infrastructure as code (IaC) in a team environment to ensure collaboration, traceability, and automation?

- A. Make the change programmatically via the cloud CLI.
- B. Use the public cloud console to make the change after approval.
- C. Make the change via the public cloud API endpoint.
- **D. Submit a pull request and wait for an approved merge of the proposed changes.**
- E. Clone the repository containing your infrastructure code and then run the code.

Answer: D

Explanation:

Detailed Explanation:

* Rationale for Correct Answer (B): IaC best practice is to manage infrastructure through version- controlled code. Changes should be reviewed and approved (via PRs), ensuring collaboration, traceability, and automation.

* Analysis of Incorrect Options:

* A, D, E: Making direct/manual changes bypasses IaC practices and causes drift.

* C: Running code without PR review skips collaboration and approval.

* Key Concept: Infrastructure as Code emphasizes version control + peer review + automation.

NEW QUESTION # 21

Which of these commands makes your code more human readable?

- A. Terraform output
- B. Terraform validate
- C. Terraform fmt
- D. Terraform show

Answer: C

Explanation:

The command that makes your code more human readable is terraform fmt. This command is used to rewrite Terraform configuration files to a canonical format and style, following the Terraform language style conventions and other minor adjustments for readability. The command is optional, opinionated, and has no customization options, but it is recommended to ensure consistency of style across different Terraform codebases. Consistency can help your team understand the code more quickly and easily, making the use of terraform fmt very important. You can run this command on your configuration files before committing them to source control or as part of your CI/CD pipeline.

NEW QUESTION # 22

Your risk management organization requires that new AWS S3 buckets must be private and encrypted at rest.

How can Terraform Cloud automatically and proactively enforce this security control?

- A. With an S3 module with proper settings for buckets
- B. With a Sentinel policy, which runs before every apply
- C. Auditing cloud storage buckets with a vulnerability scanning tool
- D. By adding variables to each Terraform Cloud workspace to ensure these settings are always enabled

Answer: B

Explanation:

Explanation

The best way to automatically and proactively enforce the security control that new AWS S3 buckets must be private and encrypted at rest is with a Sentinel policy, which runs before every apply. Sentinel is a policy as code framework that allows you to define and enforce logic-based policies for your infrastructure. Terraform Cloud supports Sentinel policies for all paid tiers, and can run them before any terraform plan or terraform apply operation. You can write a Sentinel policy that checks the configuration of the S3 buckets and ensures that they have the proper settings for privacy and encryption, and then assign the policy to your Terraform Cloud organization or workspace. This way, Terraform Cloud will prevent any changes that violate the policy from being applied.
