Actual4Exams is a reputable and highly regarded platform that provides comprehensive preparation resources for the SnowPro Advanced Architect Certification (ARA-C01). For years, Actual4Exams has been offering real, valid, and updated ARA-C01 Exam Questions, resulting in numerous successful candidates who now work for renowned global brands.

To become SnowPro Advanced Architect certified, candidates must pass the Snowflake ARA-C01 exam. ARA-C01 exam is designed to test the candidate's ability to design and implement advanced Snowflake solutions, as well as their ability to troubleshoot and optimize Snowflake implementations. The SnowPro Advanced Architect certification is a valuable credential for architects and engineers who work with the Snowflake platform, as it demonstrates their expertise in designing and implementing complex Snowflake solutions. SnowPro Advanced Architect Certification certification is recognized by Snowflake and its partners and is a valuable asset for those looking to advance their career in the data warehousing and data analytics space.

To earn the Snowflake ARA-C01 certification, candidates must pass a rigorous exam that covers a wide range of topics related to Snowflake architecture and functionality. ARA-C01 Exam consists of 60 multiple-choice questions and is timed for 90 minutes. ARA-C01 exam is computer-based and can be taken at any authorized testing center or remotely from a candidate's home or office.

Snowflake ARA-C01 certification exam is designed to test a candidate's knowledge and skills related to Snowflake's advanced architectural concepts. It is a rigorous exam that requires candidates to have a strong understanding of Snowflake's architecture, data modeling, performance tuning, security, and data integration. ARA-C01 exam is divided into multiple sections, each of which covers

a specific topic related to Snowflake's architecture. Candidates must demonstrate their proficiency in each section to earn their certification.

Snowflake SnowPro Advanced Architect Certification Sample Questions (Q87-Q92):

NEW QUESTION # 87

How does a standard virtual warehouse policy work in Snowflake?

- A. It conserves credits by keeping running clusters fully loaded rather than starting additional clusters.
- B. It starts only if the system estimates that there is a query load that will keep the cluster busy for at least 2 minutes.
- C. It starts only if the system estimates that there is a query load that will keep the cluster busy for at least 6 minutes.
- **D. It prevents or minimizes queuing by starting additional clusters instead of conserving credits.**

Answer: D

Explanation:

Explanation

A standard virtual warehouse policy is one of the two scaling policies available for multi-cluster warehouses in Snowflake. The other policy is economic. A standard policy aims to prevent or minimize queuing by starting additional clusters as soon as the current cluster is fully loaded, regardless of the number of queries in the queue. This policy can improve query performance and concurrency, but it may also consume more credits than an economic policy, which tries to conserve credits by keeping the running clusters fully loaded before starting additional clusters. The scaling policy can be set when creating or modifying a warehouse, and it can be changed at any time.

NEW QUESTION # 88

An Architect has chosen to separate their Snowflake Production and QA environments using two separate Snowflake accounts. The QA account is intended to run and test changes on data and database objects before pushing those changes to the Production account. It is a requirement that all database objects and data in the QA account need to be an exact copy of the database objects, including privileges and data in the Production account on at least a nightly basis.

Which is the LEAST complex approach to use to populate the QA account with the Production account's data and database objects on a nightly basis?

- **A. 1) Create a share in the Production account for each database
2) Share access to the QA account as a Consumer
3) The QA account creates a database directly from each share
4) Create clones of those databases on a nightly basis
5) Run tests directly on those cloned databases**
- B. 1) Create a stage in the Production account
2) Create a stage in the QA account that points to the same external object-storage location
3) Create a task that runs nightly to unload each table in the Production account into the stage
4) Use Snowpipe to populate the QA account
- C. 1) Enable replication for each database in the Production account
2) Create replica databases in the QA account
3) Create clones of the replica databases on a nightly basis
4) Run tests directly on those cloned databases

- D. 1) In the Production account, create an external function that connects into the QA account and returns all the data for one specific table
2) Run the external function as part of a stored procedure that loops through each table in the Production account and populates each table in the QA account

Answer: A

NEW QUESTION # 89

Which of the following are characteristics of Snowflake's parameter hierarchy?

- A. Table parameters override virtual warehouse parameters.
- B. Virtual warehouse parameters override user parameters.
- C. Schema parameters override account parameters.
- D. Session parameters override virtual warehouse parameters.

Answer: C

Explanation:

This is the correct answer because it reflects the characteristics of Snowflake's parameter hierarchy. Snowflake provides three types of parameters that can be set for an account: account parameters, session parameters, and object parameters. All parameters have default values, which can be set and then overridden at different levels depending on the parameter type. The following diagram illustrates the hierarchical relationship between the different parameter types and how individual parameters can be overridden at each level:

As shown in the diagram, schema parameters are a type of object parameters that can be set for schemas. Schema parameters can override the account parameters that are set at the account level. For example, the LOG_LEVEL parameter can be set at the account level to control the logging level for all objects in the account, but it can also be overridden at the schema level to control the logging level for specific stored procedures and UDFs in that schema².

The other options listed are not correct because they do not reflect the characteristics of Snowflake's parameter hierarchy. Session parameters do not override virtual warehouse parameters, because virtual warehouse parameters are a type of session parameters that can be set for virtual warehouses. Virtual warehouse parameters do not override user parameters, because user parameters are a type of session parameters that can be set for users. Table parameters do not override virtual warehouse parameters, because table parameters are a type of object parameters that can be set for tables, and object parameters do not affect session parameters¹.

NEW QUESTION # 90

An Architect runs the following SQL query:

```
SELECT
  METADATA$FILENAME,
  METADATA$FILE_ROW_NUMBER
FROM @FILEROWS/Food_Reviews.csv
   (file_format=CSV_N)
```

How can this query be interpreted?

- A. FILERONS is the file format location. FILE_ROW_NUMBER is a stage.
- B. FILEROWS is the table. FILE_ROW_NUMBER is the line number in the table.
- C. FILEROWS is a stage. FILE_ROW_NUMBER is line number in file.
- D. FILEROWS is a file. FILE_ROW_NUMBER is the file format location.

Answer: C

NEW QUESTION # 91

Following objects can be cloned in snowflake

- A. Internal stages
- B. Transient table
- C. Permanent table
- D. External tables
- E. Temporary table

Answer: B,C,D

Explanation:

* Snowflake supports cloning of various objects, such as databases, schemas, tables, stages, file formats, sequences, streams, tasks, and roles. Cloning creates a copy of an existing object in the system without copying the data or metadata. Cloning is also known as zero-copy cloning¹.

* Among the objects listed in the question, the following ones can be cloned in Snowflake:

* Permanent table: A permanent table is a type of table that has a Fail-safe period and a Time Travel retention period of up to 90 days. A permanent table can be cloned using the CREATE TABLE ... CLONE command². Therefore, option A is correct.

* Transient table: A transient table is a type of table that does not have a Fail-safe period and can have a Time Travel retention period of either 0 or 1 day. A transient table can also be cloned using the CREATE TABLE ... CLONE command². Therefore, option B is correct.

* External table: An external table is a type of table that references data files stored in an external location, such as Amazon S3, Google Cloud Storage, or Microsoft Azure Blob Storage. An external table can be cloned using the CREATE EXTERNAL TABLE ... CLONE command³. Therefore, option D is correct.

* The following objects listed in the question cannot be cloned in Snowflake:

* Temporary table: A temporary table is a type of table that is automatically dropped when the session ends or the current user logs out. Temporary tables do not support cloning⁴. Therefore, option C is incorrect.

* Internal stage: An internal stage is a type of stage that is managed by Snowflake and stores files in Snowflake's internal cloud storage. Internal stages do not support cloning⁵. Therefore, option E is

* incorrect.
