## Linux Foundation Certified GitOps Associate Sample Questions (Q58-Q63):

### NEW QUESTION # 58

Can you choose one example where Configuration as Code may be utilized to manage an application's configuration and source code?

- A. Using a manual process of editing configuration files and manually syncing the source code of a monolithic application.
- B. Using a spreadsheet to manually update and manage the configuration and source code of a mobile application.
- C. Using a GUI-based configuration tool to visually configure and manage the source code of a microservices architecture.
- D. **Using a Helm chart to define and manage the configuration and container image of a web application deployed on Kubernetes.**

### Answer: D

Explanation:

Configuration as Code is a GitOps-related practice where configurations are stored as declarative definitions in version control. Helm charts, for example, allow applications deployed on Kubernetes to have both their container images and configuration specified declaratively.

"Configuration as Code enables teams to manage application and infrastructure configuration in version control systems, using declarative approaches such as Kubernetes manifests or Helm charts. This ensures repeatability, automation, and auditability." Thus, Helm charts are a prime example of this practice, making C correct.

### NEW QUESTION # 59

In GitOps practices, when does CD take part?

- A. CI plays a significant role in GitOps practices.
- B. CD takes part simultaneously with CI, both components of GitOps practices.
- C. **CD takes part after CI to automate the deployment of applications based on changes in the Git repository.**
- D. CD takes part before CI stage in order to ensure the successful deployment of applications.

### Answer: C

Explanation:

In GitOps, Continuous Deployment (CD) follows after Continuous Integration (CI). CI is responsible for building and testing application code, while CD automates the delivery and deployment of these changes into runtime environments. The Git repository serves as the single source of truth, and when CI merges new changes into the main branch, CD reconciles the state of the environment to match what is declared in Git.

"GitOps builds on the principles of DevOps by using Git as the source of truth for declarative infrastructure and applications. CI pipelines handle the integration and testing of code, and CD pipelines or agents automatically reconcile the desired state in Git with the actual state in the cluster." This shows that CD is triggered after CI to handle deployment automation, ensuring systems remain in sync with what is declared in version control.

### NEW QUESTION # 60

You are working on a GitOps project and have made some changes to the cluster using kubectl. What is the recommended approach to ensure that your changes are continuously reconciled?

- A. Use kubectl to delete all resources that were changed in the cluster and wait for a reconcile.
- B. Reconcile the changes by running a script or command that synchronizes the cluster with the desired state.
- C. **Save those changes to the Desired State store and allow the GitOps controller to attempt reconciliation.**
- D. Delete and recreate the cluster from scratch to ensure a clean and controlled state.

### Answer: C

Explanation:

In GitOps, Git is the single source of truth. If changes are made manually in the cluster (via `kubectl`), those changes will drift from the desired state in Git. To ensure consistency, the correct approach is to update the Git repository (Desired State store) so that the reconciler can continuously apply and maintain those changes.

"The desired state must always be declared in Git. Manual changes in the cluster will be overwritten by reconciliation unless they are committed to the Git repository." Thus, the correct answer is B.

### NEW QUESTION # 61

In a GitOps-managed workflow, what is the correct way to initiate rollback?

- A. Create a new version based on a former version so you always "roll forward".
- B. Revert to an older version and force push to the main branch.
- C. Overwrite your existing version with the code from your last working version.
- D. Use Helm to rollback to a previous release version.

**Answer: A**

Explanation:

In GitOps, rollback is handled via version control. However, the practice is not to overwrite history but to roll forward by creating a new version that reverts to the configuration of a previous known-good commit. This maintains immutability and a complete audit trail.

"With GitOps, changes are versioned immutably. Rollbacks are performed by rolling forward to a commit that represents a previous known-good configuration, ensuring history is preserved." Thus, the correct GitOps approach is B.

References: GitOps Principles (CNCF GitOps Working Group), Rollback and Recovery Practices.

### NEW QUESTION # 62

Which of these Git commands will enact a rollback of the configuration to a previous commit?

- A. `git branch`
- B. `git push`
- C. `git revert`
- D. `git commit`

**Answer: C**

Explanation:

In GitOps, rollback is performed by reverting the system's Desired State stored in Git. This is done with the `git revert` command, which creates a new commit that undoes the changes introduced by a previous commit.

"Because Git provides an immutable history of changes, rollbacks are straightforward. Reverting to a previous configuration is accomplished by reverting the commit in Git, which then allows the reconciler to apply the earlier desired state." Thus, the correct answer is B: `git revert`.
