100% Pass Quiz 2026 Salesforce - Plat-Dev-301 - Salesforce Certified Platform Developer II - Multiple Choice Dumps Discount

In the process of preparing the passing test, our Plat-Dev-301 guide materials and service will give you the oriented assistance. We can save your time and energy to arrange time schedule, search relevant books and document, ask the authorized person. As our Plat-Dev-301 Study Materials are surely valid and high-efficiency, you should select us if you really want to pass Plat-Dev-301 exam one-shot. With so many advantages of our Plat-Dev-301 training engine to help you enhance your strength, why not have a try?

Salesforce Certified Platform Developer II - Multiple Choice Sample Questions (Q109-Q114):

NEW QUESTION # 109

Universal Containers uses a custom Lightning page to provide a mechanism to perform a step-by-step wizard search for Accounts. One of the steps in the wizard is to allow the user to input text into a text field, ERP Number_c, that is then used in a query to find matching Accounts.

Which step should be taken to resolve the issue?

- A. Mark the ERP_Numker = field as an external ID.
- B. Perform the SOQL query as part of a for loop.
- C. Mark the ERP_Number__c field as required.
- **D. Move the SOQL query to within an asynchronous process.**

Answer: D

Explanation:

If a SOQL query is causing performance issues due to a non-selective query on a large data volume, moving the query to an asynchronous process such as a Batch Apex or Queueable Apex can help resolve the issue. This allows the query to run in the background without affecting the user's experience.

NEW QUESTION # 110

Universal Containers needs to integrate with their own, existing, internal custom web application. The web application accepts JSON payloads, resizes product images, and sends the resized images back to Salesforce.

What should the developer use to implement this integration?

- A. A flow with an outbound message that contains a session ID
- B. A platform event that makes a callout to the web application
- **C. An Apex trigger that calls an @future method that allows callouts**
- D. A flow that calls an @future method that allows callouts

Answer: C

Explanation:

In a scenario where an integration requires making a callout to an external web application, Apex is often used to perform callouts. The callout must be asynchronous when being made from a trigger because a callout cannot be made from a synchronous operation like a trigger due to the possibility of long-running transactions.

Option A (An Apex trigger that calls an @future method that allows callouts) is correct because it enables the trigger to perform an asynchronous callout to the external web application, which is necessary for sending JSON payloads and receiving the resized images.

Options B, C, and D do not fit the requirement as well as option A because platform events and flows are typically not used for making direct callouts to external systems in the context described.

Apex Developer Guide: Apex Web Services and Callouts

NEW QUESTION # 111

A developer needs to store variables to control the style and behavior of a Lightning Web Component.

Which feature can be used to ensure that the variables are testable in both Production and all Sandboxes?

- **A. Custom metadata**
- B. Custom object
- C. Custom setting
- D. Custom variable

Answer: A

Explanation:

Custom metadata types are the best feature for storing variables that control style and behavior of a Lightning Web Component. Unlike custom settings, custom metadata is deployable and testable in both Production and all Sandboxes.

NEW QUESTION # 112

Which three actions must be completed in a Lightning web component for a JavaScript file in a static resource to be loaded?
Choose 3 answers

- A. Append the static resource to the DOM.
- **B. Import a method from the platformResourceLoader.**
- **C. Call loadScript.**
- **D. Import the static resource.**
- E. Reference the static resource in a <script> tag.

Answer: B,C,D

NEW QUESTION # 113

A page throws an 'Attempt to dereference a null object' error for a Contact.
What change in the controller will fix the error?

- A. Change the getter's signature to be static Contact.
- B. Declare a static final Contact at the top of the controller.
- **C. Use a condition in the getter to return a new Contact if it is null. G Change the setter's signature to return a Contact.**

Answer: C

Explanation:

The error 'Attempt to dereference a null object' often occurs when trying to access a member of a null object. By checking if the object is null in the getter method and returning a new instance if it is, the error can be prevented.
