

1z0-076 Studienmaterialien: Oracle Database 19c: Data Guard Administration & 1z0-076 Zertifizierungstraining

P.S. Kostenlose 2025 Oracle 1z0-076 Prüfungsfragen sind auf Google Drive freigegeben von ITZert verfügbar:
<https://drive.google.com/open?id=15zBhT-NUWxBWKWZFo2fu6cLa5Q35bSsM>

Wir bemühen uns nun darum, den Kandidaten rechtzeitigen und effizienten Service zu bieten, um Ihre wertvolle Zeit zu ersparen. ITZert bietet Ihnen zahlreiche Lerntipps, Fragen und Antworten zur Oracle 1z0-076 Zertifizierungsprüfung. Einige Websites bieten Ihnen auch Lernmaterialien zur 1z0-076 Zertifizierungsprüfung, die von guter Qualität ist und mit dem Zeit Schritt halten. Aber ITZert ist die einzige Website, die beste Schulungsunterlagen zur 1z0-076 Zertifizierungsprüfung bietet. Mit Hilfe der Lernmaterialien und der Anleitung von ITZert können Sie die Oracle 1z0-076 Zertifizierungsprüfung einmalig bestehen.

Oracle 1z0-076 Prüfungsplan:

Thema	Einzelheiten
Thema 1	Performing Role Transitions: Here, the concept of database roles is explained, along with the steps for performing switchovers, failovers, and maintaining physical standby sessions during role transitions.
Thema 2	Managing Physical Standby Files After Structural Changes on the Primary Database: The topic covers managing structural changes in the primary database and their impact on physical standby files.
Thema 4	Enhanced Client Connectivity in a Data Guard Environment: This topic focuses on enhancing client connectivity in a Data Guard setup and implementing failover procedures for seamless client redirection. It also covers application continuity to ensure uninterrupted operations during role transitions.
Thema 5	Monitoring a Data Guard Broker Configuration: The topic covers the use of Enterprise Manager and DGMGRL to monitor Data Guard configurations and explains the various data protection modes available.
Thema 6	Using Flashback Database in a Data Guard Configuration: This topic covers the configuration and advantages of using Flashback Database in a Data Guard setup, as well as the process of enabling fast-start failover for seamless role changes.
Thema 7	Backup and Recovery Considerations in an Oracle Data Guard Configuration: In this topic, Backup and recovery procedures in a Data Guard configuration are discussed, including RMAN backups, offloading to physical standby, and network-based recovery.

Oracle 1z0-076 Prüfungsmaterialien, 1z0-076 Pruefungssimulationen

Sie können im Internet teilweise die Fragenkataloge zur Oracle 1z0-076 Zertifizierungsprüfung von ITZert kostenlos herunterladen. Dann würden Sie sich ganz gelassen auf Ihre Prüfung vorbereiten. Wählen Sie die zielgerichteten Schulungsunterlagen, können Sie ganz leicht die Oracle 1z0-076 Zertifizierungsprüfung bestehen.

Oracle Database 19c: Data Guard Administration 1z0-076 Prüfungsfragen mit Lösungen (Q19-Q24):

19. Frage

There are currently 6 apply and 6 pfile processes running and no idle apply processes on a logical standby database. The max_SERVERS SQL apply parameter and number of archiver processes are both set to 12. Identify two changes, each of which would allow you to increase the number of apply processes.

- A. Increase the RECOVERY_PARALLEL initialization parameter.
- **B. Increase the value for the MAX_SERVERS SQL apply parameter.**
- C. Increase the processes initialization parameter. D Decrease the number of FREPARER processes.
- D. Decrease the number of archiver processes on the standby database.
- **E. Increase the parallel_max_server initialization parameter.**

Antwort: B,E

Begründung:

To increase the number of apply processes on a logical standby database, the following changes can be made:

* C: Increasing the value for the MAX_SERVERS SQL apply parameter would allow for more apply processes to be initiated, assuming that system resources permit.

* D: Increasing the PARALLEL_MAX_SERVERS initialization parameter would allow for more parallel execution processes, which can be used by SQL apply to increase the number of apply processes.

Option A is incorrect as decreasing the number of archiver processes will not necessarily increase the number of apply processes; these are unrelated components.

Option B is incorrect because the 'FREPARER' processes do not exist, it seems to be a typographical error, and the 'REPARER' is not a valid Oracle process or parameter.

Option E is incorrect because the RECOVERY_PARALLELISM parameter controls the number of processes used for instance recovery and media recovery, not for SQL apply.

References: Oracle Data Guard Concepts and Administration guide details the configuration and tuning of SQL apply-related parameters in logical standby databases.

20. Frage

A customer asks for your recommendation regarding this requirement:

1. We plan to have a Data Guard Configuration with one primary database and one physical standby database.
2. We want zero data loss in case of a disaster involving the loss of one component.
3. We want to do Real Application Testing occasionally on the Standby Database.

Which solution, if any, satisfies these requirements?

- A. A snapshot standby database with real time query that can be converted regularly into a physical standby database open read write, to do real application testing
- B. These requirements cannot be met.
- C. A far sync instance plus a snapshot standby database and real time apply that can be converted regularly into logical standby database to do real application testing
- **D. A physical standby database with synchronous redo transport that can be converted regularly into a snapshot standby to do real application testing**

Antwort: D

Begründung:

* Synchronous redo transport for zero data loss (B): To guarantee zero data loss in the case of a disaster, synchronous redo transport must be configured between the primary and standby databases.

* Conversion to snapshot standby for testing (B): A physical standby database can be temporarily converted into a snapshot standby database to perform real application testing. After testing is completed, the snapshot standby can be converted back to a physical standby to resume its disaster recovery role.

* Oracle Data Guard Concepts and Administration Guide

21. Frage

You are licensed to use Oracle Active Data Guard.

Which TWO statements are true after enabling block change tracking on a physical standby database?

- **A. It allows fast incremental backups to be offloaded to the physical standby database.**
- B. It allows fast incremental backups to be offloaded to a snapshot standby database, when the physical standby database is converted.
- C. It starts the CTWR process on the physical standby database instance.
- **D. It starts the RVWR process on the physical standby database instance.**
- E. It allows fast incremental backups to be taken on the primary database.
- F. It starts the CTWR process on the primary database instance.

Antwort: A,D

Begründung:

Block change tracking is a feature that enhances the efficiency of incremental backups by recording changed blocks in a tracking file. When used with Oracle Active Data Guard:

It starts the RVWR process on the physical standby database instance (A): When block change tracking is enabled on a physical standby database, the Recovery Writer (RVWR) process is initiated. This process is responsible for recording the changes to blocks in the block change tracking file, which is then used to optimize incremental backups.

It allows fast incremental backups to be offloaded to the physical standby database (E): With block change tracking enabled on the physical standby database, fast incremental backups can be offloaded from the primary database. This reduces the workload on the primary database and utilizes the standby database for backup operations, improving overall system performance and efficiency.

22. Frage

Which three statements are true about snapshot standby databases?

- **A. A resize command to extend the size of a datafile in the snapshot standby database, which was created in the snapshot standby database, will succeed.**
- **B. A resize command to extend the size of a datafile in the snapshot standby database, which was created in the primary database, will succeed.**
- **C. A resize command to reduce the size of an empty datafile in the snapshot standby database, which was created in the snapshot standby database, will succeed.**
- D. A resize command to reduce the size of an empty datafile in the snapshot standby database, which was created in the physical standby database, will succeed.
- E. A resize command to reduce the size of an empty datafile in the snapshot standby database, which was created in the primary database, will succeed.

Antwort: A,B,C

23. Frage

Your Data Guard configuration consists of these components and settings:

1. A primary database
2. A remote physical standby database
3. Real-time query is enabled
4. Redo transport mode is synchronous
5. Protection mode is maximum availability
6. The Data Guard broker is used

You notice that the standby destination fails to acknowledge reception of redo within `net_timeout` period of time.

Which is true in this scenario?

- A. The physical standby database instance is shut down by the Data Guard broker.

- B. Real-time query will be disabled on the physical standby.
- **C. Synchronous redo transport mode connections to the standby database are terminated.**
- D. The protection mode will automatically change to Maximum Performance.

Antwort: C

Begründung:

In a Data Guard configuration where the protection mode is set to Maximum Availability and synchronous redo transport is enabled, if the standby destination fails to acknowledge the reception of redo within the net_timeout period, the primary database will terminate the synchronous redo transport mode connections to the standby database to protect the primary database from hanging (C). The primary database then operates in a Maximum Performance mode until the issue is resolved. This behavior ensures that the primary database can continue to process transactions even when the standby database is temporarily unavailable.

References: The Oracle Data Guard Broker documentation and Oracle Data Guard Concepts and Administration guide detail the behavior of different protection modes and the response to network timeouts, including the fallback to asynchronous redo transport to maintain primary database availability.

24. Frage

.....

Möchten Sie die Oracle 1z0-076 Zertifizierungsprüfung beim ersten Versuch bestehen? Auf der Webseite ITZert werden wir alle Ihrer Wünsche erfüllen und Ihnen versprechen, dass Sie die 1z0-076 Zertifizierungsprüfung in begrenzter Zeit einmalig bestehen. Denn ITZert verfügt über die Fragenkataloge zur Oracle 1z0-076 Zertifizierungsprüfung, die von erfahrenen IT-Experten entworfen werden und aus Fragen und Antworten kombiniert sind. Sie werden niemals bereuen, dass Sie ITZert gewählt haben. bearbeitet
