Your application is using an Object Storage bucket named app-data in the namespace vision, to store both persistent and temporary data. Every week all the temporary data should be deleted to limit the storage consumption. Currently you need to navigate to the Object Storage page using the web console, select the appropriate bucket to view all the objects and delete the temporary ones. To simplify the task you have configured the application to save all the temporary data with /temp prefix. You have also decided to use the Command Line Interface (CLI) to perform this operation. What is the command you should use to speed up the data cleanup? (Choose the best answer.)

- A. `oci os object delete app-data in vision where prefix = /temp`
- B. `oci os object delete -ns vision -bn app-data --prefix /temp`
- C. `oci objectstorage bulk-delete -ns vision -bn app-data --prefix /temp -force`
- **D. `oci os object bulk-delete -ns vision -bn app-data --prefix /temp --force`**

- A. Replication replaces the need for block volume backups.
- B. Replication is synchronous, so it may slightly degrade block volume performance.
- C. The cost of the replica matches the cost of the source volume; for example, the replica of a high-performance volume will be billed at the high-performance rate.
- **D. The replica cannot be directly mounted on a compute instance. Instead, it must be activated, creating a clone that will be available for mounting.**
