

1z1-076 Interactive Questions - 1z1-076 Authentic Exam Hub

[Jun-2024] Free 1z1-076 Exam Dumps to Improve Exam Score [Q15-Q37]

DOWNLOAD the newest ValidDumps 1z1-076 PDF dumps from Cloud Storage for free: https://drive.google.com/open?id=1T6e8NPZZeA_Q3n04OJhbnDszqe5Bt60b

We provide a wide range of learning and preparation methodologies to the customers for the 1z1-076 complete training. After using the 1z1-076 products, success would surely be the fate of customer because, self-evaluation, highlight of the mistakes, time management and sample question answers in comprehensive manner, are all the tools which are combined to provide best possible results. We are also offering 100% money back guarantee to the customers in case they don't achieve passing scores in the Oracle 1z1-076 in the first attempt.

Using ValidDumps 1z1-076 exam study material you will get a clear idea of the actual Oracle 1z1-076 test layout and types of 1z1-076 exam questions. On the final Oracle 1z1-076 exam day, you will feel confident and perform better in the Oracle 1z1-076 certification test. Oracle 1z1-076 dumps come in three formats: Oracle 1z1-076 PDF Questions formats, Web-based and desktop Oracle 1z1-076 practice test software are the three best formats of ValidDumps 1z1-076 valid dumps. 1z1-076 pdf dumps file is the more effective and fastest way to prepare for the Oracle 1z1-076 exam.

>> 1z1-076 Interactive Questions <<

1z1-076 Practice Materials: Oracle Database 19c: Data Guard Administration & 1z1-076 Real Exam Dumps - ValidDumps

Are you planning to appear in the Oracle Database 19c: Data Guard Administration (1z1-076) certification test and need to know where to get updated practice questions? Then you are at the right place because Oracle Database 19c: Data Guard Administration (1z1-076) has made the learning material for the applicants to prepare successfully for the certification exam in a short time.

Oracle Database 19c: Data Guard Administration Sample Questions (Q100-Q105):

NEW QUESTION # 100

Your Data Guard environment has a remote physical standby database with real-time query enabled, which is used for reporting, and a logical standby database used for DSS reporting.

Switchovers or failovers are possible due to testing or in case of a disaster.

Clients use local TNSNAMES.ORA files to define connection strings to the database instances.

Which three will prevent clients from connecting to the wrong database instances?

- A. A service name is registered with the local listener of each database instance.
- B. Client TNS entries for the databases use the correct service names for the intended service.

- C. Oracle Net connectivity to the primary database instance must be established on all the standby database instances.
- **D. The client applications must use the correct TNS entries when requesting connections to the database instances.**
- E. The LOCAL_LISTENER parameter on the primary database instance must always be set.
- **F. The standby database services must be defined statically with the Listeners running on the standby database hosts.**
- G. The DB_NAME and DB_UNIQUE_NAME parameters must be set to the same value for all the databases in the Data Guard environment.

Answer: B,D,F

Explanation:

Based on Oracle Database 19c: Data Guard Administration documents, the three measures that can prevent clients from connecting to the wrong database instances during switchovers, failovers, or regular operations in a Data Guard environment are:

- * B. The standby database services must be defined statically with the Listeners running on the standby database hosts.
- * D. The client applications must use the correct TNS entries when requesting connections to the database instances.
- * E. Client TNS entries for the databases use the correct service names for the intended service.
- * In an Oracle Data Guard configuration, correctly configuring Oracle Net Services (including TNS entries and listeners) is crucial for ensuring that clients connect to the appropriate database instance, whether it's the primary or standby. Defining services on the standby database and associating them with listeners ensures that client applications can connect to the standby when needed, especially useful in a role transition or when the standby is open for read-only access or real-time query. It's essential that TNS entries used by client applications specify the correct service names that correspond to the intended database roles, such as primary or standby. This setup facilitates seamless connectivity to the appropriate instance based on the role, especially critical during switchovers and failovers when the roles of the databases change.
- * References: Oracle's Data Guard concepts and administration guide provides extensive information on configuring network services for Data Guard environments, ensuring that applications connect to the correct database instance based on the current role of the databases in the Data Guard configuration.

NEW QUESTION # 101

Which two steps must be performed before running DUPLICATE TARGET DATABASE FOR STANDBY using RMAN?

- **A. Transfer a copy of the password file from the primary host to the standby host.**
- B. Create an SPFILE for the standby database.
- **C. Configure Oracle Net connectivity between the primary host and the standby host.**
- D. Create a standby control file.
- E. Run the nid utility to modify the DBID of the primary database.

Answer: A,C

NEW QUESTION # 102

Examine the Data Guard configuration:

```
DGMGRL> show configuration;

Configuration - Animals

Protection Mode: MaxAvailability

Databases:
dogs - Primary database
cats - Physical standby database
sheep - Physical standby database

Fast-Start Failover: DISABLED

Configuration Status:

ORA-01034: ORACLE not available
ORA-16625: cannot reach database "dogs"
DGM-17017: unable to determine configuration status
```

Which three will be true after a successful failover to Cats?

- **A. Sheep will be in the enabled state.**
- **B. The configuration will be in Maximum Availability mode.**
- **C. Dogs will be in the disabled state and has to be manually reinstated.**
- D. The configuration will be in Maximum Performance mode.
- E. Sheep will be in the disabled state.

Answer: A,B,C

Explanation:

After a successful failover to the 'cats' database in a Data Guard configuration:

B: Sheep, being another standby database, would typically remain in the enabled state unless specifically disabled or if there was a configuration issue.

D: Dogs, which was the primary database prior to failover, will be in a disabled state as part of the failover process. Manual intervention is required to re-establish 'dogs' as a standby database or to return it to the primary role through another role transition.

E: If the configuration was in Maximum Availability mode before failover, it would remain in this mode after failover, provided all settings were properly configured and no changes were made to the protection mode.

Option A is incorrect because failover does not automatically change the protection mode to Maximum Performance. The protection mode remains as it was prior to the failover unless manually altered.

NEW QUESTION # 103

Your Data Guard environment consists of these components and settings:

1. A primary database
2. A remote physical standby database
3. Real-time query is enabled.
4. The redo transport mode is set to SYNC.
5. The protection mode is set to Maximum Availability.

You notice that queries executed on the physical standby database receive errors: ORA-03172:

STANDBY_MAX_DATA_DELAY of 15 seconds exceeded. Which two would you recommend to avoid this error?

- A. Change the protection mode to Maximum Protection.
- B. Change the protection mode to Maximum Performance.
- C. Increase the number of standby redo log files on the primary database.
- **D. Increase the network bandwidth between the primary and standby databases.**
- **E. Reduce I/O latency for the storage used by the primary database.**
- F. Increase the size of the buffer cache on the standby database instance.

Answer: D,E

Explanation:

The ORA-03172: STANDBY_MAX_DATA_DELAY error indicates that the real-time query on the physical standby database is experiencing delays beyond the specified maximum data delay threshold. Increasing the network bandwidth (Option D) can enhance the speed at which redo data is transferred from the primary to the standby database, thereby reducing the likelihood of exceeding the STANDBY_MAX_DATA_DELAY threshold. Reducing I/O latency on the primary database's storage (Option E) ensures that redo data is generated and shipped more efficiently, further mitigating the risk of delay. These actions, focused on optimizing data transfer and processing speed, address the root causes of the ORA-03172 error in a synchronous Data Guard configuration operating in Maximum Availability mode.

NEW QUESTION # 104

On your logical standby database, you specified these rules:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML',-  
  SCHEMA_NAME => 'HR', -  
  OBJECT_NAME => 'EMP_NEW');  
  
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML',-  
  SCHEMA_NAME => 'HR', -  
  OBJECT_NAME => 'EMP_OLD');
```

After completion of the weekend batch cycle you attempt to delete the SQL Apply filters:

```
SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP (STMT => 'DML',-  
  SCHEMA_NAME => 'HR', -  
  OBJECT_NAME => 'EMP%');
```

Which is TRUE regarding the execution of the UNSKIP procedure?

- A. It succeeds only if SQL apply is stopped before deleting the SQL Apply filter.
- B. It returns an error because the syntax to delete a SQL Apply filter must specify the same object names as specified when the filter was added.

- C. It succeeds but the SQL Apply filters are not deleted.
- **D. It deletes both the SQL Apply filters.**
- E. It succeeds only if all DML statements executed on the primary have been applied on the logical standby deleting the SQL Apply filter.

Answer: D

Explanation:

The execution of the UNSKIP procedure is designed to remove SQL Apply filters that have been previously set up on a logical standby database. Based on the provided statements, the UNSKIP procedure is directed to delete any SQL Apply filters for DML statements associated with objects in the 'HR' schema that start with 'EMP'. Since both SKIP procedures had the same schema name ('HR') and statement type ('DML'), and the UNSKIP procedure uses a wildcard (%) for the object name, it will successfully remove both of the SQL Apply filters for 'EMP_NEW' and 'EMP_OLD', as both object names match the pattern provided in the UNSKIP procedure.

References: Oracle's Data Guard documentation and SQL Language Reference provide insights into managing SQL Apply filters on a logical standby database using the DBMS_LOGSTDBY package. This includes adding and removing filters through SKIP and UNSKIP procedures.

NEW QUESTION # 105

.....

You have to upgrade your skills and knowledge then you will be in a position to compete in the modern world. The Oracle 1z1-076 certification offers a great way to learn new in-demand skills and upgrade your knowledge level. To do this you just need to enroll in the 1z1-076 Exam and put in your efforts to pass this career booster 1z1-076 certification exam.
