C1000-189 Reliable Exam Preparation & C1000-189 Latest Exam Book
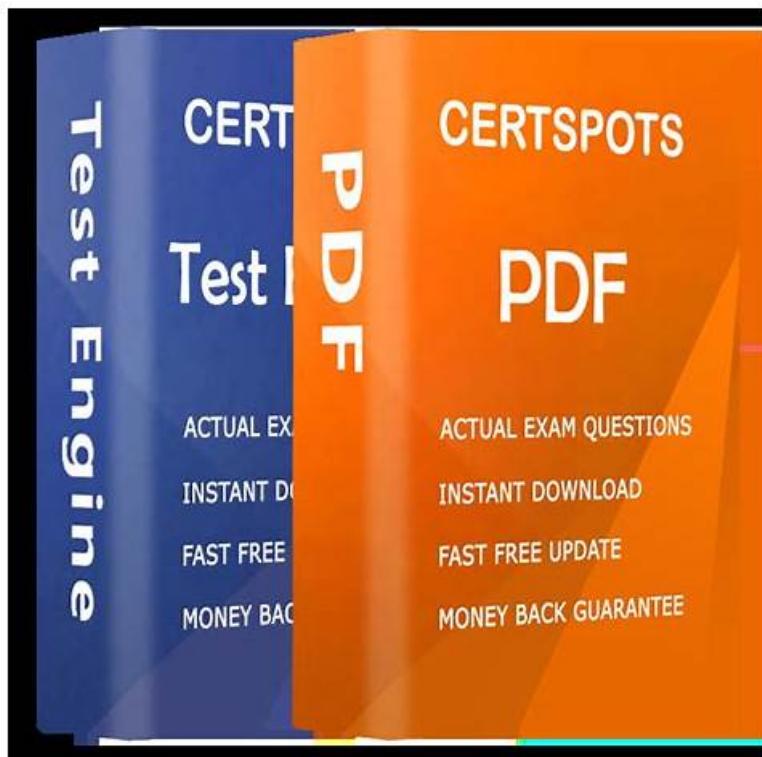

Pass rate is 98.45% for C1000-189 learning materials, which helps us gain plenty of customers. You can pass the exam and obtain the certification successfully if you choose us. C1000-189 exam braindumps contain both questions and answers, and it's convenient for you to check the answers after practicing. You can try free demo before buying C1000-189 Exam Materials, so that you can know what the complete version is like. We provide you with free update for 365 days after purchasing, and the update version for C1000-189 exam dumps will be sent to you automatically. You just need to check your email and change your learning ways according to new changes.

IBM C1000-189 Exam Syllabus Topics:

Topic	Details
Topic 1	• Security and Compliance: This section of the exam measures the skills of IT Security Analysts and focuses on the data protection and compliance aspects of Instana deployment. Candidates must describe and implement data retention policies, plan for regulatory compliance, secure APIs, manage user access, and interpret audit logs. The goal is to ensure secure system configurations that align with organizational and regulatory standards.
Topic 2	• Operations: This section of the exam measures the skills of Application Monitoring Specialists and covers daily operational tasks for managing Instana environments. It includes configuring website and application monitoring, handling synthetic monitoring, and creating incidents, issues, and alerts. Candidates will analyze infrastructure performance, set maintenance windows, and design custom dashboards. They are also expected to interpret golden signals, evaluate alerts, use analytics, and perform backup or restore operations to maintain optimal system performance.

Topic 3	• Planning: This section of the exam measures the skills of Cloud Monitoring Engineers and covers the foundational planning tasks required for successful Instana deployment. Candidates must understand the installation prerequisites, the architectural design of Instana for on-premises environments, and the platform core capabilities and use cases. It also assesses knowledge of different agent modes, supported sensors and tracers, and the distinctions between cloud service agents and serverless agents essential for scalable implementation.
Topic 4	• Configuration: This section of the exam measures the skills of DevOps Administrators and evaluates their ability to configure and optimize Instana operational settings. It involves setting up business process monitoring, configuring both cloud and serverless agents, and defining agent proxy parameters. Candidates will learn to implement various technologies and sensors, manage OpenTelemetry integrations, set up smart alerts, create service naming rules, and define custom SLIs and payloads for alert channels. Managing licenses and ensuring proper configuration of alerts and notifications are also key components of this domain.
Topic 5	• Troubleshooting: This section of the exam measures the skills of System Support Engineers and focuses on resolving technical and operational issues in Instana. It includes configuring log levels, collecting logs for debugging, and identifying connectivity issues between agents and the backend. Candidates will troubleshoot installation failures, diagnose communication problems, and apply corrective measures to ensure consistent Instana performance and stability across environments.
Topic 6	• Integration: This section of the exam measures the skills of Integration Engineers and assesses their proficiency in connecting Instana with external monitoring and automation tools. Candidates must demonstrate knowledge of integrating agent-based systems such as Omegamon, ITM, and ITCAM, as well as external platforms like Prometheus and Grafana. The section also includes configuring alert channels, automation actions, and utilizing the Instana REST API to support customized workflows and data visibility.

Free PDF Quiz 2026 IBM C1000-189 High Hit-Rate Reliable Exam Preparation

The PDF version of the ITPassLeader IBM C1000-189 prep material is easily accessible. This format is ideal for someone who is constantly on the move, as you can prepare for your IBM Instana Observability v1.0.277 Administrator - Professional (C1000-189) exam whether you are using your smartphone, tablet, or laptop. You can study anywhere, at any time, without having to worry about installing anything. Furthermore, you can study with a hard copy by printing all of your IBM Instana Observability v1.0.277 Administrator - Professional (C1000-189) PDF questions. We offer regular updates in PDF format to improve IBM Instana Observability v1.0.277 Administrator - Professional (C1000-189) questions according to changes in the exam.

IBM Instana Observability v1.0.277 Administrator - Professional Sample Questions (Q21-Q26):

NEW QUESTION # 21
What is the default log level set to collect Log4j syslog for Instana agent configuration?

- A. Error
- B. Debug
- C. Warning
- D. Info

Answer: D

Explanation:
As outlined in the Instana agent deployment documentation, the default log level for gathering Log4j syslog information is Info. The documentation reads: "The default log level for syslog collection in Instana agents with Log4j integration is Info, enabling monitoring of operational and sensor activity without excessive diagnostic output." Info level is chosen as a best-practice default to log key

events like agent startup, sensor activations, and health check results. Debug, Warning, and Error thresholds are for troubleshooting or failure analyses and may be set manually for deep inspection but are not preselected at install. Optimal Info-level logging ensures administrators receive actionable messages without burdening disk or log forwarding pipelines. Configuration files can be adjusted for verbose output; however, initial deployments and automated frameworks always rely on Info as the default value.

NEW QUESTION # 22

Which order of precedence applies if a user is a member of multiple groups and the level of access is not the same?

- A. Access all, Limited access, No access
- B. No access, Limited access, Access all
- C. Limited access, No access, Access all
- D. Access all, No access, Limited access

Answer: B

Explanation:

According to IBM Instana documentation, access rights for users belonging to multiple groups are resolved by applying the most restrictive role. The documentation states: "If a user belongs to more than one group, the permissions are set according to the order: No access > Limited access > Access all. If there's a conflict, 'No access' always takes precedence, followed by 'Limited access,' then 'Access all.'" This ensures that users do not gain unintended permissions due to overlapping group assignments and supports the principle of least privilege. This behavior is critical for security compliance and consistent access control, especially in regulated environments or where different teams have varying visibility requirements. By enforcing the strictest restriction, Instana reduces risk from misconfigurations and accidental escalation of privilege, and helps satisfy audit trail and governance requirements in enterprise use cases.

NEW QUESTION # 23

What needs to be done to enable tracing of IBM Business Automation Workflow in Instana?

- A. Use the Instana Web UI to enable it.
- B. Create a new dashboard manually.
- C. Install additional software.
- D. Modify the configuration.yaml file.

Answer: A

Explanation:

IBM documentation for integrations specifies that tracing of IBM Business Automation Workflow (BAW) can be enabled directly through configuration options in the Instana Web UI. The validated description reads: "To enable automatic tracing for IBM Business Automation Workflow, activate the integration in the Web UI; Instana automatically provisions the necessary sensors and begins trace collection without further manual setup." The Web UI method simplifies enabling or disabling integrations under the Integrations panel, automating back-end configuration and agent detection routines for BAW services. Additional software installation or manual configuration.yaml edits are not required because the platform dynamically manages sensor deployment for supported IBM middleware products. Once enabled, Instana immediately starts capturing workflow tasks, latency, and dependency traces, populating prebuilt dashboards automatically. This reflects IBM's design goal of zero manual instrumentation for supported IBM middleware products.

NEW QUESTION # 24

What is highly recommended when integrating a few hundred IBM APM v8 agents with Instana?

- A. Enable the APM sensor directly on the configuration.yaml file.
- B. Increase the JVM memory of the Instana host agent.
- C. Install the Instana Agent on multiple servers.
- D. Re-install the IBM APM 8 server.

Answer: B

Explanation:
IBM Instana Observability documentation makes it clear that, when integrating many IBM APM v8 agents with a single Instana

Agent host, it is highly recommended to increase the JVM memory allocation of the Instana host agent. The official guidance is: "If integrating several hundred APM v8 agents with a single Instana host agent, make sure to increase the Java Virtual Machine (JVM) heap size on the Instana host agent, as the default settings may not suffice for the heightened metric ingestion and processing load." Without this adjustment, the host agent could experience memory pressure, leading to dropped metrics, agent restarts, or degraded ingestion. This step is essential for scaling and ensuring metric reliability in high-volume environments, as detailed in the agent performance tuning and scalability section of IBM's documentation. Other options (A, B, D) do not address the resource requirements driven by metric collection at scale.

NEW QUESTION # 25

Which statement best describes BeeInstana?

- A. An operator that can be used only on self-hosted deployments that have data stores installed
- B. An operator that can be used to install Instana on Kubernetes
- C. A Kubernetes operator that requires high-performing data stores and a distributed data store cluster.
- D. It is a metric database used to perform complex metric queries

Answer: C

Explanation:
BeeInstana is identified in Instana's documentation as the core Kubernetes operator driving distributed installation and management of Instana components. The documentation defines: "BeeInstana is a Kubernetes operator that requires robust, high-performing distributed data stores and manages Instana deployment complexity, resource allocation, and scaling within large clusters." By leveraging Kubernetes-native constructs, BeeInstana orchestrates Instana backend, UI, sensors, and streaming components-ensuring reliable, scalable deployments for enterprise settings. The operator orchestrates failover, recovery, and persistent storage management, supporting self-hosted and hybrid installations. While it is associated with metric data handling, its main role is orchestration and operational management based on distributed database infrastructures. Simple operator installation (A, D) does not capture its full role, and describing BeeInstana as only a metric database (B) misrepresents its architectural function in Instana's platform lifecycle.
