Real Exam4PDF CGOA Questions for Quick Success

Our company has taken a lot of measures to ensure the quality of CGOA preparation materials. It is really difficult for yourself to hire a professional team, regularly investigate market conditions, and constantly update our CGOA exam questions. But we have all of them done for you. And our CGOA study braindumps have the advantage of high-effective. Just look at our pass rate of our loyal customers, with the help of our CGOA learning guide, 98% of them passed the exam successfully.

Linux Foundation Certified GitOps Associate Sample Questions (Q21-Q26):

NEW QUESTION # 21

What doesPulled Automaticallyrefer to?

- A. It always refers to Git pull.
- B. A GET request to a relational database.
- C. Accessing the Desired State from the State Store.
- D. Webhooks informing the system about new commits.

Answer: C

Explanation:

ThePulled AutomaticallyGitOps principle refers to the way software agents continuously access theDesired Statestored in the State Store (e.g., Git). Agents automatically pull the state from the repository and reconcile the system accordingly.

"Software agents automatically pull the desired state declarations from the source of truth (State Store) and continuously reconcile the system to match." Thus, the correct answer isD.

References:GitOps Principles (CNCF GitOps Working Group).

NEW QUESTION # 22

What is one of the key benefits of a pull-based reconciliation approach to configuration management?

- A. Agents can access the Desired State at any time, not only when an event is triggered.
- B. Immediate response time to configuration changes.
- C. The CI has access credentials to the running system.
- D. Simplified troubleshooting and debugging processes.

Answer: A

Explanation:

In GitOps, the pull-based reconciliation approach means that agents continuously monitor the Desired State in Git. Unlike push-based systems, which only act when triggered, pull-based systems can reconcile at any time, providing resilience, self-healing, and security (since no external system needs direct access to the cluster).

"In a pull-based model, reconciliation agents continuously fetch and compare the desired state, enabling self-healing and ensuring the desired configuration is accessible at all times." Thus, the correct answer is B.

References: GitOps Principles (CNCF GitOps Working Group), Pull vs. Push reconciliation models.

NEW QUESTION # 23

In a GitOps framework, what distinct advantage does Configuration as Code (CaC) provide in comparison to traditional infrastructure management approaches?

- A. GitOps leverages CaC for immutable infrastructure deployments, ensuring consistent environments, unlike traditional methods that allow ad-hoc changes.
- B. CaC is less secure and more complex than traditional infrastructure management.
- C. In GitOps, CaC enables dynamic resource allocation during runtime, contrasting with the static configurations in traditional methods.
- D. CaC in GitOps exclusively automates the documentation process, whereas traditional approaches focus on manual documentation.

Answer: A

Explanation:

Configuration as Code (CaC) in GitOps ensures that infrastructure and application definitions are stored in Git, version-controlled, and immutable. Unlike traditional approaches (manual changes, scripts, mutable infrastructure), GitOps uses CaC for immutable infrastructure deployments, guaranteeing reproducibility and environment consistency.

"Configuration as Code ensures that system configuration is stored declaratively in version control. This allows immutable deployments, reproducibility, consistency across environments, and prevents ad-hoc manual changes." Thus, the distinct advantage is immutable deployments and consistent environments, making B correct.

NEW QUESTION # 24

Manual updates are common causes of what?

- A. Changes in actual state leading to variance.
- B. Changes in Desired State leading to drift.
- C. Changes in Desired State leading to failure.
- D. Changes in actual state leading to drift.

Answer: D

Explanation:

In GitOps, the desired state is stored in Git. Manual updates applied directly to the cluster (via kubectl or APIs) change the actual state without updating Git. This introduces drift between actual and desired state.

"Manual changes to the runtime environment cause the actual state to diverge from the desired state stored in Git. This drift must be detected and reconciled automatically." Thus, the correct answer is C.

References: GitOps Principles (CNCF GitOps Working Group), Drift and Reconciliation.

NEW QUESTION # 25

In GitOps, what is a pull-based approach?

- A. A pull-based approach is when the Git repository automatically pushes changes to the GitOps system, which then applies them
- B. A pull-based approach is when the GitOps system sends notifications to developers to apply changes from the Git repository manually.
- C. A pull-based approach is when developers manually push changes to the GitOps system, which then applies them automatically.
- **D. A pull-based approach is when the GitOps system continuously polls the Git repository for changes and applies them automatically.**

Answer: D

Explanation:

In GitOps, pull-based deployment is fundamental. Instead of pushing changes into a cluster, GitOps agents running inside the cluster continuously pull from Git to reconcile desired state.

"GitOps uses a pull-based model: agents inside the cluster continuously poll the Git repository for desired state changes. If changes are found, they reconcile the live system automatically to match the declared state." This ensures secure, automated, and consistent deployments.

Thus, D is correct.
