Direct and dependable WGU Data-Management-Foundations Exam Questions in three formats will surely help you pass the WGU Data Management – Foundations Exam Data-Management-Foundations certification exam. Because this is a defining moment in your career, do not undervalue the importance of our WGU Data Management – Foundations Exam Data-Management-Foundations Exam Dumps. Profit from the opportunity to get these top-notch exam questions for the WGU Data-Management-Foundations certification test.

WGU Data Management – Foundations Exam Sample Questions (Q54-Q59):

NEW QUESTION # 54

Which constraint propagates primary key changes to foreign keys?

- A. RESTRICT
- B. SET NULL
- C. SET DEFAULT
- D. CASCADE

Answer: D

Explanation:

The CASCADE constraint ensures that updates or deletions in the primary key table automatically reflect in the foreign key table.

Example Usage:

sql

```
CREATE TABLE Departments (  
  DeptID INT PRIMARY KEY,  
  DeptName VARCHAR(50)  
);  
  
CREATE TABLE Employees (  
  EmpID INT PRIMARY KEY,  
  Name VARCHAR(50),  
  DeptID INT,  
  FOREIGN KEY (DeptID) REFERENCES Departments(DeptID) ON UPDATE CASCADE ON DELETE CASCADE );
```

* If DeptID changes in Departments, it automatically updates in Employees.

* If a DeptID is deleted, all employees in that department are also deleted.

Why Other Options Are Incorrect:

* Option A (SET DEFAULT) (Incorrect): Sets foreign key values to a default value, rather than propagating changes.

* Option B (SET NULL) (Incorrect): When the referenced key is deleted, dependent records are set to NULL instead of being updated/deleted.

* Option C (RESTRICT) (Incorrect): Prevents deletion of a referenced row if dependent foreign key rows exist.

Thus, the correct answer is CASCADE, as it propagates primary key changes to dependent foreign keys.

NEW QUESTION # 55

What is the role of the transaction manager within the database system architecture?

- A. The transaction manager uses information from the catalog to perform query optimization.
- B. The transaction manager translates the query processor instructions into filesystem commands and uses an index to quickly locate the requested data.
- **C. The transaction manager logs insert, update, and delete queries, and the result is sent back to the application.**
- D. The transaction manager is composed of a query processor, storage manager, transaction manager, log, and catalog.

Answer: C

NEW QUESTION # 56

Which object relates an entity to itself in an entity-relationship model?

- A. Repository
- B. Attribute
- **C. Reflexive relationship**
- D. Relationship instance

Answer: C

Explanation:

A reflexive relationship (also called unary relationship) occurs when an entity is related to itself.

Example Usage:

A screenshot of a computer AI-generated content may be incorrect.

EmployeeID	Name	ManagerID
1	Alice	NULL
2	Bob	1
3	Carol	1

```
CREATE TABLE Employees (  
  EmpID INT PRIMARY KEY,  
  Name VARCHAR(50),  
  ManagerID INT,  
  FOREIGN KEY (ManagerID) REFERENCES Employees(EmpID)  
);
```

* ManagerID refers to another employee within the same table.

Why Other Options Are Incorrect:

- * Option A (Repository) (Incorrect): A data storage structure, not a relationship type.
- * Option B (Relationship instance) (Incorrect): Describes a specific connection between entities, not a reflexive relationship.
- * Option D (Attribute) (Incorrect): Attributes store characteristics, but do not define relationships.

Thus, the correct answer is Reflexive relationship, as it relates an entity to itself.

NEW QUESTION # 57

Which phase of entity-relationship modeling refers to the maxima and minima of relationships and attributes?

- A. Partition
- B. Physical design
- C. Attribute minimum
- **D. Cardinality**

Answer: D

Explanation:

Cardinality defines the minimum and maximum number of occurrences of one entity in relation to another.

Example Usage in an ER Model:

* One-to-Many (1:M): A customer can place multiple orders, but each order belongs to only one customer.

Customers (1) --- (M) Orders

* Cardinality notation:

(1,1) # One-to-One

(0,M) # Zero-to-Many

(1,M) # One-to-Many

Why Other Options Are Incorrect:

- * Option B (Physical design) (Incorrect): Focuses on storage and indexing, not relationships.
- * Option C (Attribute minimum) (Incorrect): No such formal term in database modeling.
- * Option D (Partition) (Incorrect): Refers to dividing tables, not relationship constraints.

Thus, the correct answer is Cardinality, as it defines min/max constraints on relationships.

NEW QUESTION # 58

What is the role of a query processor in the database system architecture?

- A. It writes log records before applying changes to the database.
- **B. It uses information from the catalog to perform query optimization.**
- C. It sends results back to the application that requested the queries.
- D. It translates instructions into file system commands.

Answer: B

Explanation:

A query processor is responsible for query optimization and execution in a database management system (DBMS). It analyzes SQL statements, optimizes execution plans, and ensures efficient retrieval of data.

* Option A (Correct): The query processor optimizes queries by analyzing metadata from the system catalog to determine the best execution strategy.

* Option B (Incorrect): Logging transactions before applying changes is the responsibility of the transaction manager.

* Option C (Incorrect): Translating instructions into file system commands is handled by the storage manager, not the query processor.

* Option D (Incorrect): While the query processor helps retrieve results, the database engine and API layer are responsible for returning results to applications.
