ISACA Certified in Risk and Information Systems Control Sample Questions (Q1119-Q1124):

NEW QUESTION # 1119
The risk associated with an asset after controls are applied can be expressed as:

- A. the magnitude of an impact.
- B. a function of the cost and effectiveness of controls.
- C. the likelihood of a given threat.
- D. a function of the likelihood and impact.

Answer: D

Explanation:
The risk associated with an asset after controls are applied can be expressed as a function of the likelihood and impact, as it helps to measure and quantify the residual risk level and exposure. Residual risk is the risk that remains after the implementation of controls or risk treatments. Residual risk can be calculated by multiplying the likelihood and impact of a risk event, where likelihood is the probability or frequency of the risk event occurring, and impact is the consequence or severity of the risk event on the asset or objective. Residual risk can be expressed as:
ResidualRisk=LikelihoodxImpact
Expressing the risk associated with an asset after controls are applied as a function of the likelihood and impact helps to provide the following benefits:
* It enables a data-driven and evidence-based approach to risk assessment and reporting, rather than relying on subjective or qualitative judgments.
* It facilitates a consistent and standardized way of measuring and communicating risk levels and exposure across the organization and to the external stakeholders.
* It supports the alignment of risk management and control activities with the organizational strategy and objectives, and helps to evaluate the achievement of the desired outcomes.
* It helps to identify and prioritize the areas for improvement and enhancement of the risk management and control processes, and guide the development and implementation of corrective or preventive actions.
* It provides feedback and learning opportunities for the risk management and control processes, and helps to foster a culture of continuous improvement and innovation.
The other options are not the best ways to express the risk associated with an asset after controls are applied. A function of the cost and effectiveness of controls is a measure of the inputs or outputs of the risk management and control processes, but it does not indicate the risk level or exposure. The likelihood of a given threat is a component of the risk calculation, but it does not reflect the impact or consequence of the threat. The magnitude of an impact is a component of the risk calculation, but it does not reflect the likelihood or probability of the risk event. NEW QUESTION # 1120
The following is the snapshot of a recently approved IT risk register maintained by an organization's information security department.

Risk ID	Risk Title	Risk Description	Risk Submitter	Risk Owner	Control Owner(s)	Risk Likelihood Rating	Risk Impact Rating	Risk Exposure	Risk Response Type	Risk Response Description
R001	Mobile Data Theft	Laptops and mobile devices can be lost or stolen leading to data compromise	Risk Council	End-User Computing Manager AND Inventory	IT Operations Manager AND Security Operations Manager	Low Likelihood	Very Serious	0.120	Mitigate	Purchase and acquire data encryption software for mobi
R003	Fire Hazard	A fire accident may destroy data center equipment and servers leading to loss of availability and services	Information Security Department	Data Center Facilities Manager	Facilities Manager	Low Likelihood	Serious	0.060	Transfer	Buy fire hazard insurance policy
		A disgruntled								
Significant					0.10	Low Likelihood				0.30
Serious					0.20	Likely				0.50
Very Serious					0.40	Highly Likely				0.70

After implementing countermeasures listed in "Risk Response Descriptions" for each of the Risk IDs, which of the following component of the register MUST change?

- A. Risk Exposure
- B. Risk Likelihood Rating
- C. Risk Owner
- D. Risk Impact Rating

Answer: A

Explanation:
Risk exposure is the product of risk likelihood and risk impact ratings. It represents the potential loss or damage that may result from a risk event. After implementing countermeasures, the risk likelihood and/or impact ratings may change, depending on the effectiveness of the countermeasures. Therefore, the risk exposure must also change to reflect the updated risk ratings. The other components of the register, such as risk owner, risk impact rating, and risk likelihood rating, may or may not change depending on the nature and scope of the countermeasures. NEW QUESTION # 1121
Reviewing which of the following provides the BEST indication of an organizations risk tolerance?

- A. Risk assessments
- B. Risk sharing strategy
- C. Risk transfer agreements
- D. Risk policies

Answer: D

Explanation:
Risk policies provide the best indication of an organization's risk tolerance, as they define the acceptable level of risk and the risk appetite of the organization. Risk policies also establish the roles and responsibilities, methodologies, and reporting mechanisms for risk management. Risk sharing strategy, risk transfer agreements, and risk assessments are not the best indicators of risk tolerance, as they are more related to risk response, risk mitigation, and risk identification, respectively.
