### Oracle Database 19c: Data Guard Administration Sample Questions (Q87-Q92):

#### NEW QUESTION # 87

Examine this validate command:

```
DGMGRL> VALIDATE DATABASE VERBOSE "<database name>";
```

Which THREE statements are TRUE?

- A. The command performs a comparison of SPFILE entries between the primary database and a specified standby database.
- B. The command uses information available in various Oracle Data Guard views as well as the Automatic Diagnostic Repository.
- C. The command performs network connectivity checks between members of a broker configuration.
- D. The command performs a comprehensive set of database checks prior to a role change.
- E. The command can be used for a logical standby database.

**Answer: C,D,E**

Explanation:

\* The command performs a comprehensive set of database checks prior to a role change (A): The VALIDATE DATABASE command in Data Guard Manager (DGMGRL) is designed to perform an exhaustive check of a specified database's readiness for a role change, such as a switchover or failover.

\* The command performs network connectivity checks between members of a broker configuration (C): One of the checks includes verifying that the necessary network connectivity exists between the databases in a Data Guard Broker configuration.

\* The command can be used for a logical standby database (D): The VALIDATE DATABASE command is versatile and can be used for both physical and logical standby databases to ensure their readiness for role changes.

#### NEW QUESTION # 88

Which THREE are true about using flashback database in a Data Guard environment?

- A. You can use it when real-time apply is enabled in case the phylt may not be used to flash back a primary database after a failover to a logical standby.
- B. You can use it when real-time apply is enabled in case the physical standby suffers from logical corruption.
- C. When a flashback database operation is performed on a primary database, a physical standby database is also flashed back automatically.
- D. When a flashback database operation is performed on a primary database, a logical standby database is also flashed back automatically.
- E. It may be used to flash back a physical standby that receives redo from a far sync instance.
- F. It may not be used to flash back a primary database after a failover to a physical standby.

**Answer: B,E,F**

Explanation:

Flashback Database is a feature that allows reverting a database to a previous point in time, which is extremely useful in various Data Guard configurations:

It may be used to flash back a physical standby that receives redo from a far sync instance (C): Flashback Database can be used on a physical standby database to revert it to a past point in time, even when it is receiving redo data from a far sync instance. This can be particularly useful to recover from logical corruptions or unwanted changes.

You can use it when real-time apply is enabled in case the physical standby suffers from logical corruption (D): Even when real-time apply is enabled, which allows redo data to be applied to the standby database as soon as it is received, Flashback Database can be

used to revert the physical standby database to a point in time before the logical corruption occurred.

It may not be used to flash back a primary database after a failover to a physical standby (E): After a failover has occurred from a primary to a physical standby database, making the standby the new primary, Flashback Database cannot be used to revert the old primary database to a state before the failover because the failover operation makes irreversible changes to the database role and configuration.

#### NEW QUESTION # 89

A Data Guard environment has this configuration and these attributes:

A primary database

A physical standby database named sbdb

The configuration is in maximum availability protection mode.

Then sbdb is converted to a snapshot standby database.

Which two statements are true?

- A. The recovery time objective increases.
- **B. sbdb can still receive redo.**
- **C. The recovery point objective increases.**
- D. sbdb can still apply redo.
- E. The protection mode is lowered to maximum performance.

**Answer: B,C**

#### NEW QUESTION # 90

Which two statements are true regarding Data Guard environments in an Oracle Multi-tenant architecture?

- A. Different redo transport methods can be configured for different pluggable databases within one Data Guard environment.
- B. PDB\_FILE\_NAME\_CONVERT must be set to enable creation of standby databases if they are created on the same host as the primary.
- **C. A Data Guard environment with a multi-tenant primary database can operate in any Protection mode.**
- **D. The Data Guard broker may be used for multi-tenant databases.**
- E. Standby redo log files are required for each pluggable database that is protected with Data Guard.

**Answer: C,D**

Explanation:

Oracle Multi-tenant architecture and Data Guard have several interactions, but specific aspects hold true in such environments:

The Data Guard broker may be used for multi-tenant databases (B): Data Guard Broker simplifies the management and monitoring of Data Guard configurations and is fully compatible with the Oracle Multi-tenant architecture, allowing for easy management of Data Guard configurations that include multi-tenant container databases (CDBs) and their pluggable databases (PDBs).

A Data Guard environment with a multi-tenant primary database can operate in any Protection mode (E): Data Guard can be configured to operate in Maximum Performance, Maximum Availability, or Maximum Protection mode, regardless of whether the primary database is a multi-tenant database. This flexibility ensures that Data Guard can meet various data protection and availability requirements in multi-tenant environments.

#### NEW QUESTION # 91

Which THREE statements are true about snapshot standby databases?

- A. A snapshot standby database may be opened read-only.
- **B. FLASHBACK DATABASE is enabled automatically on a snapshot standby database after converting it from a physical standby database if not already enabled.**
- C. A snapshot standby database can have Real-Time apply enabled.

- D. FLASHBACK DATABASE must be manually enabled on a physical standby database before converting it into a snapshot standby database.
- E. A snapshot standby database may be opened read-write.
- F. FLASHBACK DATABASE is enabled automatically on a physical standby database as part of the conversion into a snapshot standby database, if not already enabled.

**Answer: B,E,F**

Explanation:

Snapshot standby databases are a feature of Oracle Data Guard that allows a physical standby database to be temporarily converted into a read-write database for testing or other purposes. The true statements about snapshot standby databases are:

\* FLASHBACK DATABASE is enabled automatically on a snapshot standby database after converting it from a physical standby database if not already enabled (B): When a physical standby is converted to a snapshot standby, FLASHBACK DATABASE is automatically enabled to allow the database to be easily reverted back to its original state.

\* FLASHBACK DATABASE is enabled automatically on a physical standby database as part of the conversion into a snapshot standby database, if not already enabled (C): As part of the conversion process, FLASHBACK DATABASE is turned on to ensure that changes made while the database is in snapshot standby mode can be undone.

\* A snapshot standby database may be opened read-write (E): Once a physical standby is converted to a snapshot standby, it can be opened for read-write operations, allowing for testing and other tasks that require a writable database.
