This pdf covers all of the CAS-004 Exam Questions from the previous exams as well as those that will appear in the upcoming CompTIA CAS-004 exam. The CAS-004 PDF exam questions are compiled according to the latest exam syllabus to ensure your success. The CompTIA CAS-004 PDF exam questions are also printable to make handy notes.

The CASP+ certification is recognized by major corporations and government agencies around the world. It is highly valued by employers who are looking for professionals with advanced cybersecurity skills. CompTIA Advanced Security Practitioner (CASP+) Exam certification is also recognized by the U.S. Department of Defense (DoD) and meets the requirements of the DoD 8570.01-M for Information Assurance Manager Level III and Information Assurance Technical Level III.

CompTIA CAS-004, also known as CompTIA Advanced Security Practitioner (CASP+), is a certification exam designed for experienced IT professionals seeking to validate their advanced-level security skills and knowledge. CAS-004 Exam is a vendor-neutral certification that is recognized globally and is ideal for individuals who want to demonstrate their proficiency in IT security.

## **CAS-004 Exam Bootcamp: CompTIA Advanced Security Practitioner (CASP+) Exam & CAS-004 Original Questions & CAS-004 Exam Prep**

If you want to give up your certificate exams as you fail CAS-004 exam or feel it too difficult, please think about its advantages after you obtain a CompTIA certification. Many special positions require employees to have a qualification. If you think it is very difficult for you to pass exams, our CAS-004 Valid Exam Cram PDF can help you to achieve your goal. Our exam materials are collected from the real test center and edited by our experienced experts. If you need 100% passing rate, our CAS-004 valid exam cram PDF can help you.

The CompTIA Advanced Security Practitioner (CASP+) Exam certification exam is ideal for IT professionals who have a minimum of ten years of experience in the field of IT administration and five years of experience in hands-on technical security roles. CompTIA Advanced Security Practitioner (CASP+) Exam certification exam is vendor-neutral, which means that the certification is recognized globally and not limited to a specific vendor's products.

## CompTIA Advanced Security Practitioner (CASP+) Exam Sample Questions (Q259-Q264):

### NEW QUESTION # 259

A security engineer needs to implement a solution to increase the security posture of user endpoints by providing more visibility and control over local administrator accounts. The endpoint security team is overwhelmed with alerts and wants a solution that has minimal operational burdens. Additionally, the solution must maintain a positive user experience after implementation. Which of the following is the BEST solution to meet these objectives?

- A. Implement Privileged Access Management (PAM), keep users in the local administrators group, and enable local administrator account monitoring.
- B. Implement EDR, remove users from the local administrators group, and enable privilege escalation monitoring.
- C. Implement EDR, keep users in the local administrators group, and enable user behavior analytics.
- D. Implement PAM, remove users from the local administrators group, and prompt users for explicit approval when elevated privileges are required.

**Answer: D**

Explanation:

PAM (Privileged Access Management) is a solution that can increase the security posture of user endpoints by providing more visibility and control over local administrator accounts. By implementing PAM, removing users from the local administrators group, and prompting users for explicit approval when elevated privileges are required, the security engineer can reduce the attack surface, prevent unauthorized access, and enforce the principle of least privilege. Implementing PAM, keeping users in the local administrators group, and enabling local administrator account monitoring may not provide enough control or visibility over local administrator accounts, as users could still abuse or compromise their privileges. Implementing EDR (Endpoint Detection and Response) may not provide enough control or visibility over local administrator accounts, as EDR is mainly focused on detecting and responding to threats, not managing privileges. Enabling user behavior analytics may not provide enough control or visibility over local administrator accounts, as user behavior analytics is mainly focused on identifying anomalies or risks in user activity, not managing privileges.

### NEW QUESTION # 260

A developer implement the following code snippet.

```
catch (Exception e)
{
    if(log.isDebugEnabled())
    {
        log.debug("Caught InvalidURLException Exception --"
        + e.toString());
    }
}
```

Which of the following vulnerabilities does the code snippet resolve?

- A. Buffer overflow
- B. SQL inject
- C. Missing session limit
- D. Information leakage

**Answer: B**

Explanation:

SQL injection is a type of vulnerability that allows an attacker to execute malicious SQL commands on a database by inserting them into an input field. The code snippet resolves this vulnerability by using parameterized queries, which prevent the input from being interpreted as part of the SQL command. Verified Reference: <https://www.comptia.org/training/books/casp-cas-004-study-guide> , [https://owasp.org/www-community/attacks/SQL\\_Injection](https://owasp.org/www-community/attacks/SQL_Injection)

### NEW QUESTION # 261

A developer is creating a new mobile application for a company. The application uses REST API and TLS 1.2 to communicate securely with the external back-end server. Due to this configuration, the company is concerned about HTTPS interception attacks. Which of the following would be the BEST solution against this type of attack?

- A. Cookies
- B. HSTS
- C. Certificate pinning
- D. Wildcard certificates

**Answer: C**

Explanation:

Reference:

Certificate pinning is a technique that can prevent HTTPS interception attacks by hardcoding the expected certificate or public key of the server in the application code, so that any certificate presented by an intermediary will be rejected. Cookies are small pieces of data that are stored by browsers to remember user preferences or sessions, but they do not prevent HTTPS interception attacks. Wildcard certificates are certificates that can be used for multiple subdomains of a domain, but they do not prevent HTTPS interception attacks. HSTS (HTTP Strict Transport Security) is a policy that forces browsers to use HTTPS connections, but it does not prevent HTTPS interception attacks. Verified Reference: <https://www.comptia.org/blog/what-is-certificate-pinning> <https://partners.comptia.org/docs/default-source/resources/casp-content-guide>

**NEW QUESTION # 262**

A security analyst has been provided the following partial Snort IDS rule to review and add into the company's Snort IDS to identify a CVE:

```
alert tcp any any -> $HOME_NET 3389 (flow:to_server_established; content:"MS_T1201001"; fast_pattern:only)
```

Which of the following should the analyst recommend to mitigate this type of vulnerability?

- A. TCP wrappers
- B. OS patching
- C. IPSec rules
- D. Two-factor authentication

**Answer: B**

Explanation:

Regular operating system patching is critical to mitigating vulnerabilities. When a Snort IDS rule is provided to identify a CVE, it typically means there is a known vulnerability that can be exploited. Keeping systems updated with the latest patches helps to close off these vulnerabilities and protect against exploitation.

**NEW QUESTION # 263**

A company is implementing SSL inspection. During the next six months, multiple web applications that will be separated out with subdomains will be deployed.

Which of the following will allow the inspection of the data without multiple certificate deployments?

- A. Use a third-party CA.
- B. Create a wildcard certificate.
- C. Implement certificate pinning.
- D. Include all available cipher suites.

**Answer: B**
