WGU Scripting and Programming Foundations Exam Sample Questions (Q88-Q93):

NEW QUESTION # 88

Which phase of a waterfall approach defines specifics on how to build a program?

- A. Analysis
- **B. Design**
- C. Implementation
- D. Testing

Answer: B

Explanation:

In the Waterfall approach to software development, the phase that defines and specifies how to build a program is the Design phase. This phase follows the initial Analysis phase, where the requirements are gathered, and precedes the Implementation phase, where the actual coding takes place. During the Design phase, the software's architecture, components, interfaces, and data are methodically planned out. This phase translates the requirements into a blueprint for constructing the software, ensuring that the final product will meet the specified needs.

References: The stages of the Waterfall methodology and their purposes are well-documented in project management and software engineering literature. Atlassian provides a comprehensive guide on the Waterfall methodology, detailing each phase and its significance¹. Built In also offers insights into the Waterfall methodology, including the systematic structure it provides for planning, organization, design, and testing².

These sources affirm the role of the Design phase in the Waterfall approach as the stage where the program's construction is defined.

NEW QUESTION # 89

NEW QUESTION # 90

A sample function is shown.

$$Y = -2x - 2$$

What is returned for $f(-1)$?

- A. 0

- B. 1
- **C. 2**
- D. 3

Answer: C

Explanation:

- * We start with the given function: ($Y = -2x - 2$).
- * To find ($f(-1)$), we substitute ($x = -1$) into the function.
- * Plugging in the value: ($f(-1) = -2(-1) - 2 = 2 - 2 = 0$).

NEW QUESTION # 91

What is one task that could be accomplished using a while loop?

- A. After inputting two numbers, the program prints out the larger of the two.
- B. The user inputs an integer, and the program prints out whether the number is even or odd and whether the number is positive, negative, or zero.
- C. When the user inputs a number, the program outputs "True" when the number is a multiple of 10.
- **D. A user is asked to enter a password repeatedly until either a correct password is entered or five attempts have been made.**

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

A while loop repeatedly executes a block of code as long as a condition is true, making it suitable for tasks requiring iteration until a condition changes. According to foundational programming principles, while loops are ideal for scenarios with an unknown number of iterations or conditional repetition.

* Option A: "When the user inputs a number, the program outputs 'True' when the number is a multiple of 10." This is incorrect. This task requires a single check ($\text{number} \% 10 == 0$), which can be done with an if statement, not a loop.

* Option B: "The user inputs an integer, and the program prints out whether the number is even or odd and whether the number is positive, negative, or zero." This is incorrect. This task involves a single input and multiple conditional checks, handled by if statements, not a loop.

* Option C: "After inputting two numbers, the program prints out the larger of the two." This is incorrect.

Comparing two numbers requires a single if statement (e.g., $\text{if } (a > b)$), not a loop.

* Option D: "A user is asked to enter a password repeatedly until either a correct password is entered or five attempts have been made." This is correct. This task requires repeated input until a condition is met (correct password or five attempts), which is ideal for a while loop. For example, in Python:

```
attempts = 0
while attempts < 5 and input("Password: ") != "correct":
    attempts += 1
```

NEW QUESTION # 92

A programmer receives requirements from customers and decides to build a first version of a program. Which phase of an Agile approach is being carried out when the programmer starts writing the first version?

- A. Analysis
- **B. Implementation**
- C. Design
- D. Testing

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

In Agile software development, the process is iterative, and writing code to create a version of the program occurs during the implementation phase. According to foundational programming principles and Agile methodologies (e.g., Certipoint Scripting and Programming Foundations Study Guide, Agile Manifesto), implementation involves coding the software based on requirements and design.

* Agile Phases Overview:

* Analysis: Gathers and refines requirements (e.g., customer needs as user stories).

* Design: Plans the technical solution (e.g., defining functions, classes, or architecture).

* Implementation: Writes and integrates code to create a working version.

* Testing: Verifies the code meets requirements.

* Option A: "Implementation." This is correct. Starting to write the first version of the program involves coding, which is the core activity of the implementation phase. For example, the programmer might write functions or classes to meet customer requirements.

* Option B: "Testing." This is incorrect. Testing occurs after coding to verify the program's functionality, not during the writing of the first version.

* Option C: "Design." This is incorrect. Design involves planning the program's structure (e.g., specifying functions or objects), not writing the code.

* Option D: "Analysis." This is incorrect. Analysis involves receiving and refining requirements, which the programmer has already done before starting to code.
