

2025 Snowflake Trustable ARA-C01 Valid Test Pdf

P.S. Free 2025 Snowflake ARA-C01 dumps are available on Google Drive shared by TestSimulate: <https://drive.google.com/open?id=1HWRs-pFckO0qbcE2uOFpVgDyP7yhkTO>

At TestSimulate, we offer a ARA-C01 dumps PDF, desktop Snowflake ARA-C01 practice test software, and a web-based practice exam which is specifically designed to help you prepare for your Snowflake ARA-C01 Certification Exam. Whether you are looking for real Snowflake ARA-C01 dumps pdf file or practice exams to help you master the Snowflake ARA-C01 exam, we have got you covered.

So, when you get the SnowPro Advanced Architect Certification ARA-C01 exam dumps material for your SnowPro Advanced Architect Certification ARA-C01 certification exam, you have to check whether they are providing you the SnowPro Advanced Architect Certification ARA-C01 Practice Test or not. You must choose those who shall give you the SnowPro Advanced Architect Certification ARA-C01 questions and not those who are giving you copied sheets only.

Snowflake ARA-C01 Valid Test Pdf & TestSimulate - Leader in Certification Exam Materials

Most people said the process is more important than the result, but as for ARA-C01 exam, the result is more important than the process, because it will give you real benefits after you obtain ARA-C01 exam certification in your career in IT industry. If you have made your decision to pass the exam, our ARA-C01 exam software will be an effective guarantee for you to Pass ARA-C01 Exam. Maybe you are still doubtful about our product, it doesn't matter, but if you try to download our free demo of our ARA-C01 exam software first, you will be more confident to pass the exam which is brought by our TestSimulate.

Snowflake SnowPro Advanced Architect Certification Sample Questions (Q31-Q36):

NEW QUESTION # 31

What is the MOST efficient way to design an environment where data retention is not considered critical, and customization needs are to be kept to a minimum?

- A. Use a transient table.
- B. Use a temporary table.
- C. Use a transient schema.
- D. Use a transient database.

Answer: D

Explanation:

Transient databases in Snowflake are designed for situations where data retention is not critical, and they do not have the fail-safe period that regular databases have. This means that data in a transient database is not recoverable after the Time Travel retention period. Using a transient database is efficient because it minimizes storage costs while still providing most functionalities of a standard database without the overhead of data protection features that are not needed when data retention is not a concern.

NEW QUESTION # 32

Role A has the following permissions:

- . USAGE on db1
- . USAGE and CREATE VIEW on schema1 in db1
- . SELECT on table1 in schema1

Role B has the following permissions:

- . USAGE on db2
- . USAGE and CREATE VIEW on schema2 in db2
- . SELECT on table2 in schema2

A user has Role A set as the primary role and Role B as a secondary role.

What command will fail for this user?

- A. use database db1;
use schema schema1;
select * from db2.schema2.table2;
- B. use database db2;
use schema schema2;
create view v2 as select * from db1.schema1.table1;
- C. use database db1;
use schema schema1;
create view v1 as select * from db2.schema2.table2;
- D. use database db2;
use schema schema2;
select * from db1.schema1.table1 union select * from table2;

Answer: B

Explanation:

This command will fail because while the user has USAGE permission on db2 and schema2 through Role B, and can create a view in schema2, they do not have SELECT permission on db1.schema1.table1 with Role B. Since Role A, which has SELECT permission on db1.schema1.table1, is not the currently active role when the view v2 is being created in db2.schema2, the user does not have the necessary permissions to read from db1.schema1.table1 to create the view. Snowflake's security model requires that the active role have all necessary permissions to execute the command.

NEW QUESTION # 33

An Architect runs the following SQL query:

```
SELECT
  METADATA$FILENAME,
  METADATA$FILE_ROW_NUMBER
FROM @FILEROWS/Food_Reviews.csv
(file_format=CSV_N)
```

How can this query be interpreted?

- A. FILEROWS is a file. FILE_ROW_NUMBER is the file format location.
- B. FILERONS is the file format location. FILE_ROW_NUMBER is a stage.
- C. FILEROWS is a stage. FILE_ROW_NUMBER is line number in file.

- D. FILEROWS is the table. FILE_ROW_NUMBER is the line number in the table.

Answer: C

Explanation:

- * A stage is a named location in Snowflake that can store files for data loading and unloading. A stage can be internal or external, depending on where the files are stored.
- * The query in the question uses the LIST function to list the files in a stage named FILEROWS. The function returns a table with various columns, including FILE_ROW_NUMBER, which is the line number of the file in the stage.
- * Therefore, the query can be interpreted as listing the files in a stage named FILEROWS and showing the line number of each file in the stage.

References:

- * : Stages
- * : LIST Function

NEW QUESTION # 34

To convert JSON null value to SQL null value, you will use

- **A. STRIP_NULL_VALUE**
- B. IS_NULL_VALUE
- C. NULL_IF

Answer: A

NEW QUESTION # 35

A company has an external vendor who puts data into Google Cloud Storage. The company's Snowflake account is set up in Azure. What would be the MOST efficient way to load data from the vendor into Snowflake?

- A. Copy the data from Google Cloud Storage to Azure Blob storage using external tools and load data from Blob storage to Snowflake.
- B. Ask the vendor to create a Snowflake account, load the data into Snowflake and create a data share.
- C. Create a Snowflake Account in the Google Cloud Platform (GCP), ingest data into this account and use data replication to move the data from GCP to Azure.
- **D. Create an external stage on Google Cloud Storage and use the external table to load the data into Snowflake.**

Answer: D

Explanation:

The most efficient way to load data from the vendor into Snowflake is to create an external stage on Google Cloud Storage and use the external table to load the data into Snowflake (Option B). This way, you can avoid copying or moving the data across different cloud platforms, which can incur additional costs and latency.

You can also leverage the external table feature to query the data directly from Google Cloud Storage without loading it into Snowflake tables, which can save storage space and improve performance. Option A is not efficient because it requires the vendor to create a Snowflake account and a data share, which can be complicated and costly. Option C is not efficient because it involves copying the data from Google Cloud Storage to Azure Blob storage using external tools, which can be slow and expensive. Option D is not efficient because it requires creating a Snowflake account in the Google Cloud Platform (GCP), ingesting data into this account, and using data replication to move the data from GCP to Azure, which can be complex and time-consuming. References:

The answer can be verified from Snowflake's official documentation on external stages and external tables available on their website. Here are some relevant links:

- * Using External Stages | Snowflake Documentation
- * Using External Tables | Snowflake Documentation
- * Loading Data from a Stage | Snowflake Documentation
