## SPLK-1004 Valid Exam Format - Reliable SPLK-1004 Test Testking

Don't be trapped by one exam and give up the whole Splunk certification. If you have no confidence in passing exam, TorrentVCE

releases the latest and valid SPLK-1004 guide torrent files which is useful for you to get through your exam certainly. The earlier you pass exams and get certification with our SPLK-1004 Latest Braindumps, the earlier you get further promotion and better benefits. Sometimes opportunity knocks but once. Timing is everything.

## **Splunk Core Certified Advanced Power User Sample Questions (Q74-Q79):**

### **NEW QUESTION # 74**

Why is the transaction command slow in large splunk deployments?

- A. It forces the search to run in fast mode.
- B. transaction runs a hidden eval to format fields.
- **C. It forces all event data to be returned to the search head.**
- D. transaction or runs on each Indexer in parallel.

**Answer: C**

Explanation:

The transaction command can be slow in large Splunk deployments because it requires all event data relevant to the transaction to be returned to the search head (Option C). This process can be resource-intensive, especially for transactions that span a large volume of data or time, as it involves aggregating and sorting events across potentially many indexers before the transaction logic can be applied.

### **NEW QUESTION # 75**

Which of the following groups of commands can use multivalue functions?

- **A. eval,mvexpand, andmakemv**
- B. eval,fieldformat, andwhere
- C. eval,fields, andwhere
- D. fieldformat,search, andwhere

**Answer: A**

Explanation:

Comprehensive and Detailed Step by Step Explanation: Multivalue functions in Splunk are used to manipulate fields that contain multiple values. The correct group of commands that can use multivalue functions is:

Copy

1

eval, mvexpand, and makemv

Here's why this works:

- \* eval: This command can use multivalue functions like mvappend(), mvcount(), and mvjoin() to manipulate multivalue fields.
- \* mvexpand: This command expands multivalue fields into separate events, making it easier to work with individual values.
- \* makemv: This command splits a single-value field into a multivalue field based on a delimiter.

Other options explained:

- \* Option A: Incorrect because fieldformat is used for formatting display values and does not support multivalue functions.
- \* Option B: Incorrect because fields is used to include or exclude fields but does not handle multivalue fields.
- \* Option C: Incorrect because fieldformat and search do not support multivalue functions.

Example:

```
| makeresults  
| eval products="productA,productB,productC"  
| makemv delim="," products  
| mvexpand products
```

References:

\* Splunk Documentation on Multivalue Functions: <https://docs.splunk.com/Documentation/Splunk/latest/SearchReference/MultivalueEvalFunctions>

\* Splunk Documentation on mvexpand: <https://docs.splunk.com/Documentation/Splunk/latest/SearchReference/mvexpand>

### **NEW QUESTION # 76**

Which of the following is accurate regarding predefined drilldown tokens?

- A. They are defined by a panel's base search.
- **B. They vary by visualization type.**
- C. There are eight categories of predefined drilldown tokens.
- D. They capture data from a form input.

**Answer: B**

Explanation:

Predefined drilldown tokens in Splunk vary by visualization type. These tokens are placeholders that capture dynamic values based on user interactions with dashboard elements, such as clicking on a chart segment or table row. Different visualization types may have different drilldown tokens.

#### NEW QUESTION # 77

What are the default time and results limits for a subsearch?

- A. 300 seconds and 10,000 results
- B. 300 seconds and 50,000 results
- **C. 60 seconds and 10,000 results**
- D. 60 seconds and 50,000 results

**Answer: C**

Explanation:

Comprehensive and Detailed Step by Step Explanation:

The default time and results limits for a subsearch in Splunk are:

\* Time Limit: 60 seconds

\* Results Limit: 10,000 results

Here's why this works:

\* Time Limit: Subsearches are designed to execute quickly to avoid performance bottlenecks. By default, Splunk imposes a timeout of 60 seconds for subsearches. If the subsearch exceeds this limit, it will terminate, and the outer search may fail.

\* Results Limit: Subsearches are also limited to returning a maximum of 10,000 results by default. This ensures that the outer search does not get overwhelmed with too much data from the subsearch.

Other options explained:

\* Option B: Incorrect because the results limit is 10,000, not 50,000.

\* Option C: Incorrect because the time limit is 60 seconds, not 300 seconds.

\* Option D: Incorrect because both the time limit (300 seconds) and results limit (50,000) exceed the default values.

Example: If a subsearch exceeds the default limits, you might see an error like:

Copy

1

Error in 'search': Subsearch exceeded configured timeout or result limit.

Splunk Documentation on Subsearch Limits: <https://docs.splunk.com/Documentation/Splunk/latest/Search/Aboutsubsearches>

Splunk Documentation on limits.conf: <https://docs.splunk.com/Documentation/Splunk/latest/Admin/Limitsconf>

#### NEW QUESTION # 78

How is a cascading input used?

- A. As a default way to delete a user role.
- B. Without notation in the underlying XML.
- C. As part of a dashboard, but not in a form
- **D. As a way to filter other input selections.**

**Answer: D**

Explanation:

A cascading input is used to filter other input selections in a dashboard or form, allowing for a dynamic user interface where one

input influences the options available in another input.

## NEW QUESTION # 79

.....

Don't let the Splunk Core Certified Advanced Power User (SPLK-1004) certification exam stress you out!
