#### NEW QUESTION # 25

According to MuleSoft which principle is common to both Service Oriented Architecture (SOA) and API-led connectivity approaches\*?

- A. Service statefulness
- **B. Service reusability**
- C. Service centralization
- D. Service interdependence

**Answer: B**

Explanation:

Both Service-Oriented Architecture (SOA) and API-led connectivity emphasize the principle of service reusability. Here's a detailed explanation:

Service Reusability:

Definition: Service reusability is the principle where services are designed to be reusable across different applications and use cases.

SOA: In SOA, services are modular components that can be reused in various business processes, reducing redundancy and promoting efficient service composition.

API-led Connectivity: This approach also stresses creating reusable APIs (System APIs, Process APIs, Experience APIs) that can be leveraged across multiple projects and applications.

Benefits:

Efficiency: Reduces development time and effort by reusing existing services.

Consistency: Ensures consistency in business logic and data access across different applications.

Scalability: Facilitates scaling by using standardized and reusable services/APIs.

MuleSoft Documentation: SOA vs. API-led Connectivity

Service Reusability: Principles of Service Reusability

#### NEW QUESTION # 26

During a planning session with the executive leadership, the development team director presents plans for a new API to expose the data in the company's order database. An earlier effort to build an API on top of this data failed, so the director is recommending a design-first approach.

Which characteristics of a design-first approach will help make this API successful?

- A. Building MUnit tests so administrators can confirm code coverage percentage during deployment
- **B. Developing a specification so consumers can test before the implementation is built**
- C. Adding global policies to the API so all developers automatically secure the implementation before coding anything
- D. Publishing the fully implemented API to Exchange so all developers can reuse the API

**Answer: B**

Explanation:

A design-first approach emphasizes creating the API specification before implementation, ensuring better alignment with consumer needs and reducing the risk of project failure. Here's a detailed explanation:

API Specification:

Definition: An API specification is a detailed, formal description of the API's endpoints, request/response formats, and protocols.

Consumer Testing: Allows API consumers (developers) to understand, test, and provide feedback on the API design before actual development begins.

Advantages:

Early Feedback: Consumers can test the API design using mock services or tools like API Designer and provide feedback, ensuring the API meets their requirements.

Reduced Rework: Identifies potential issues and design flaws early, reducing costly changes during the implementation phase.

Documentation: Provides comprehensive documentation that aids in the development and future maintenance of the API.

Design-First Approach: Design-First API Development

API Mocking: API Designer Mocking Service
