## Pass Guaranteed Quiz Salesforce Identity-and-Access-Management-Architect - Regualer Salesforce Certified Identity and Access Management Architect Update

Salesforce Certified Identity and Access Management Architect (Identity-and-Access-Management-Architect) PDF dumps are compatible with smartphones, laptops, and tablets. If you don't have time to sit in front of your computer all day but still want to get into some Salesforce Certified Identity and Access Management Architect (Identity-and-Access-Management-Architect) exam questions, Identity-and-Access-Management-Architect PdfFormat is for you. The Salesforce Certified Identity and Access Management Architect (Identity-and-Access-Management-Architect) PDF dumps are also available for candidates to print out the Salesforce Certified Identity and Access Management Architect (Identity-and-Access-Management-Architect) exam questions at any time.

## Salesforce Certified Identity and Access Management Architect Sample Questions (Q236-Q241):

### NEW QUESTION # 236

Northern Trail Outfitters (NTO) is setting up Salesforce to authenticate users with an external identity provider. The NTO Salesforce Administrator is having trouble getting things setup.

What should an identity architect use to show which part of the login assertion is failing?

- A. Connected App Manager
- **B. Security Assertion Markup Language Validator**
- C. Identity Provider Metadata download
- D. SAML Metadata file importer

**Answer: B**

Explanation:

Explanation

Security Assertion Markup Language (SAML) Validator is a tool that allows administrators to test and troubleshoot SAML single sign-on configurations. It can show which part of the login assertion is failing and provide error messages and suggestions. SAML Metadata file importer and Identity Provider Metadata download are features that allow administrators to import or download metadata files for SAML configurations. Connected App Manager is a tool that allows administrators to manage connected apps in Salesforce. References: SAML Validator, SAML Single Sign-On Settings, Connected App Manager

### NEW QUESTION # 237

UniversalContainers (UC) wants to build a few applications that leverage the Salesforce REST API. UC has asked its Architect to describe how the API calls will be authenticated to a specific user. Which two mechanisms can the Architect provide? Choose 2 Answers

- **A. Refresh Token**
- B. Session ID
- C. Authentication Token
- **D. Access Token**

**Answer: A,D**

Explanation:

These are the mechanisms that the Salesforce REST API uses for authentication. According to the Salesforce documentation<sup>1</sup>, the REST API requires an access token obtained by authentication. The access token is a session credential that represents the authorization of a specific application to access specific parts of a user's data<sup>2</sup>. The access token is valid for a limited time and can be refreshed using a refresh token. A refresh token is a credential that represents the authorization of an application to refresh an expired access token<sup>2</sup>.

Option A is incorrect because an authentication token is not used by the Salesforce REST API. An authentication token is an email security feature that appends a unique string of characters to your password when you log in from an unrecognized device or IP address<sup>3</sup>. Option B is incorrect because a session ID is not used by the Salesforce REST API. A session ID is a unique identifier for a user's session that can be used for SOAP API calls<sup>4</sup>.

### NEW QUESTION # 238

Universal Containers (UC) has implemented SSO according to the diagram below. uses SAML while Salesforce Org1 uses OAuth 2.0. Users usually start their day by first attempting to log into Salesforce Org 2 and then later in the day, they will log into either the Financial System or CPQ system depending upon their job position. Which two systems are acting as Identity Providers?

- **A. Salesforce Org 1**
- B. Salesforce Org 2
- **C. Pingfederate**
- D. Financial System

**Answer: A,C**

Explanation:

These are the systems that are acting as identity providers (IdPs) in the SSO scenario. An IdP is a trusted provider that enables a customer to use single sign-on (SSO) to access other websites<sup>5</sup>. In this case, Pingfederate and Salesforce Org 1 are the IdPs that authenticate the users and issue SAML assertions or OAuth tokens to the service providers (SPs). The SPs are the websites that host apps and rely on the IdPs for authentication<sup>5</sup>. In this case, Salesforce Org 2, Financial System, and CPQ System are the SPs

that receive the SAML assertions or OAuth tokens from the IdPs and grant access to the users.

Option A is incorrect because Financial System is not an IdP, but an SP. It does not authenticate the users, but receives SAML assertions from Pingfederate. Option C is incorrect because Salesforce Org 2 is not an IdP, but an SP. It does not authenticate the users, but receives OAuth tokens from Salesforce Org 1.

#### NEW QUESTION # 239

Universal Containers (UC) has built a custom time tracking app for its employee. UC wants to leverage Salesforce Identity to control access to the custom app.

At a minimum, which Salesforce license is required to support this requirement?

- A. Identity Connect
- B. Identity Verification
- C. Identity Only
- D. External Identity

**Answer: C**

Explanation:

To use Salesforce Identity to control access to the custom time tracking app, the identity architect should use the Identity Only license. The Identity Only license is a license type that enables users to access external applications that are integrated with Salesforce using single sign-on (SSO) or delegated authentication, but not access Salesforce objects or data. The other license types are not relevant for this scenario. References:

Identity Only License, User Licenses

#### NEW QUESTION # 240

Universal Containers (UC) uses a legacy Employee portal for their employees to collaborate and post their ideas. UC decides to use Salesforce Ideas for voting and better tracking purposes. To avoid provisioning users on Salesforce, UC decides to push ideas posted on the Employee portal to Salesforce through API. UC decides to use an API user using OAuth Username - password flow for the connection. How can the connection to Salesforce be restricted only to the employee portal server?

- A. Add the Employee portal's IP address to the Trusted IP range for the connected App
- B. Use a dedicated profile for the user the Employee portal uses.
- C. Use a digital certificate signed by the employee portal Server.
- D. Add the employee portal's IP address to the login IP range on the user profile.

**Answer: A**

Explanation:

Adding the employee portal's IP address to the trusted IP range for the connected app is the best way to restrict the connection to Salesforce only to the employee portal server. This will ensure that only requests from the specified IP range will be accepted by Salesforce for that connected app. Option B is not a good choice because using a digital certificate signed by the employee portal server may not be supported by Salesforce for OAuth username-password flow. Option C is not a good choice because adding the employee portal's IP address to the login IP range on the user profile may not be sufficient, as it will still allow other users with the same profile to log in from that IP range. Option D is not a good choice because using a dedicated profile for the user that the employee portal uses may not be effective, as it will still allow other users with that profile to log in from any IP address. References: [Connected Apps], [OAuth 2.0 Username- Password Flow]

#### NEW QUESTION # 241

.....

With the Salesforce Identity-and-Access-Management-Architect practice test, users can reduce stress, and improve their confidence to succeed. The desktop-based Salesforce Certified Identity and Access Management Architect (Identity-and-Access-Management-Architect) practice test software is compatible with Windows only. But the web-based Identity-and-Access-Management-Architect Practice Test is compatible with all operating systems.
