Exam Analytics-Arch-201 Reviews | Examcollection Analytics-Arch-201 Free Dumps

If you are still in colleges, it is a good chance to learn the knowledge of the Analytics-Arch-201 study engine because you have much time. At present, many office workers are keen on learning our Analytics-Arch-201 guide materials even if they are busy with their work. So you should never give up yourself as long as there has chances. In short, what you have learned on our Analytics-Arch-201 study engine will benefit your career development.

Salesforce Certified Tableau Architect Sample Questions (Q123-Q128):

NEW QUESTION # 123

In planning the process topology for a Tableau Server intended for a medium-sized business with moderate usage patterns, what is the most important consideration for process counts?

- A. Prioritizing only VizQL processes and minimizing others.
- B. Allocating an excessive number of all process types to prepare for unexpected peaks in demand.
- **C. Tailoring the process count to balance between VizQL, Data Server, and Backgrounder based on expected usage and demand.**
- D. Assigning an equal number of processes for each type, regardless of specific usage patterns.

Answer: C

Explanation:

Tailoring the process count to balance between VizQL, Data Server, and Back-grounder based on expected usage and demand Customizing the process count to reflect the organization's specific usage patterns ensures optimal performance without over-allocating resources, which is crucial for a medium-sized business. Option A is incorrect because over-allocating processes can be resource-intensive and unnecessary for moderate usage. Option B is incorrect as it does not account for the specific needs and usage patterns of the business. Option D is incorrect because it overlooks the importance of balancing different process types for a well-rounded performance.

NEW QUESTION # 124

For a medium-sized business with periodic high usage periods, how should the Tableau Server node count be determined?

- A. Ignoring node count considerations and focusing only on process distribution
- B. Configuring a minimal number of nodes to save on costs, despite potential performance is-sues
- **C. Establishing a scalable node configuration that can accommodate periodic high usage**
- D. Deploying a large number of nodes to prepare for peak usage, regardless of cost

Answer: C

Explanation:

Establishing a scalable node configuration that can accommodate periodic high usage A scalable configuration allows the business to efficiently handle periodic high usage periods while avoiding unnecessary costs during lower usage times. Option A is incorrect because deploying a large number of nodes for a medium-sized business can be cost-inefficient. Option B is incorrect as a minimal number of nodes may lead to performance issues during high usage periods. Option D is incorrect because considering node count is crucial for balancing performance and cost.

NEW QUESTION # 125

A large retail company with a high volume of daily Tableau users requires a configuration that optimizes query performance and user experience. Which configuration setting should be prioritized?

- **A. Increase the "vizqlserver.querylimit" value to allow more concurrent queries**
- B. Decrease the "vizqlserver.session.expiry.timeout" value to reduce session timeouts
- C. Reduce the "cache.server.timeout" value to lower the caching time
- D. Increase the "backgrounder.querylimit" value to allow more concurrent queries

Answer: A

Explanation:

Increase the "vizqlserver.querylimit" value to allow more concurrent queries In-creasing the "vizqlserver.querylimit" value allows more concurrent queries, which is crucial for a company with a high volume of daily users to improve query performance and user experience. Option A is incorrect as decreasing session timeout may disrupt user experience. Option B is incorrect because "backgrounder.querylimit" affects background tasks, not immediate user query performance. Option C is incorrect as reducing cache time might negatively impact performance for frequently accessed data.

NEW QUESTION # 126

During a blue-green deployment of Tableau Server, what is a critical step to ensure data consistency between the blue and green environments?

- A. Increasing the storage capacity of the green environment
- B. Implementing load balancing between the blue and green environments
- C. Synchronizing data and configurations between the two environments before the switch
- D. Running performance tests in the green environment

Answer: C

Explanation:

Synchronizing data and configurations between the two environments before the switch Synchronizing data and configurations between the blue and green environments is a critical step in a blue-green deployment. This ensures that when the switch is made from the blue to the green environment, the green environment is up-to-date with the latest data and settings, maintaining data consistency and preventing any loss of information or functionality. Option A is incorrect because while performance testing is important, it does not directly ensure data consistency between the two environments. Option C is incorrect as load balancing between the two environments is not typically part of a blue-green deployment strategy, which focuses on one environment being active at a time. Option D is incorrect because simply increasing storage capacity in the green environment does not directly contribute to data consistency for the deployment.

NEW QUESTION # 127

In the context of SSL encryption for Tableau Server, what is an important consideration when renewing an SSL certificate?

- A. Renewing the certificate with the exact same specifications as the old one to avoid configuration changes
- B. Ensuring that the new SSL certificate is renewed and installed before the expiration of the current certificate
- C. Temporarily disabling SSL encryption while waiting for the new certificate to be issued
- D. Switching to a different SSL protocol version during renewal for enhanced security

Answer: B

Explanation:

Ensuring that the new SSL certificate is renewed and installed before the expiration of the current certificate When renewing an SSL certificate for Tableau Server, it is important to ensure that the new certificate is renewed and installed before the current one expires. This continuity prevents any interruptions in SSL encryption and maintains secure communications without any downtime or security warnings due to an expired certificate. Option A is incorrect because the new certificate does not necessarily need to have the exact same specifications; updates or changes might be beneficial. Option C is incorrect as switching SSL protocol versions during renewal should be done based on security needs and compatibility, not as a routine process. Option D is incorrect because disabling SSL encryption, even temporarily, can expose the server to security risks.

NEW QUESTION # 128

.....

Fantasy can make people to come up with many good ideas, but it can not do anything. So when you thinking how to pass the Salesforce Analytics-Arch-201 Exam, It's better open your computer, and click the website of iPassleader, then you will see the things you want. iPassleader's products have favorable prices, and have quality assurance, but also to ensure you to 100% pass the exam.

Exam Analytics-Arch-201 Reviews: <https://www.ipassleader.com/Salesforce/Analytics-Arch-201-practice-exam-dumps.html>
