

Examcollection GH-200 Free Dumps | Top GH-200 Exam Dumps

What's more, part of that TestInsides GH-200 dumps now are free: https://drive.google.com/open?id=1giCv54I8X_bIDQ0UTaHDSIQTkFYEWz

We provide the latest Microsoft GH-200 exam dumps to help you update your knowledge and offer the GH-200 sample questions to test your level in efficient way. If you are preparing GH-200 practice tests now, our valid dumps torrent will be your best choice because you can find everything you want in our learning materials. Please contact us if you have any questions in purchasing GH-200 Exam Prep.

Microsoft GH-200 Exam Syllabus Topics:

Topic	Details
Topic 1	• Consume Workflows: This domain targets Software Developers and Quality Assurance Engineers and focuses on interpreting workflow runs and their outcomes. It covers identifying triggering events, reading workflow configurations, troubleshooting failures by analyzing logs, enabling debug logging, managing environment variables, caching dependencies, and passing data between jobs. Candidates also manage workflow runs, artifacts, approvals, and status badges, as well as locating workflows within repositories and leveraging organizational templated workflows.
Topic 2	• Manage GitHub Actions in the Enterprise: This section measures the expertise of Enterprise Administrators and Platform Engineers in distributing and managing GitHub Actions and workflows at the organizational level. It includes reuse and sharing of templates, strategies for managing reusable components via repositories and naming conventions, controlling access to actions, setting organization-wide usage policies, and planning maintenance to ensure efficient enterprise-wide deployment of GitHub Actions.
Topic 3	• Author and Maintain Actions: This domain evaluates the abilities of Action Developers and Automation Engineers to select and create suitable types of GitHub Actions, such as JavaScript, Docker containers, or run steps. It emphasizes troubleshooting action code, understanding the components and file structures of actions, and using workflow commands within actions to communicate with runners, including exit code management.

Topic 4	• Author and Maintain Workflows: This section of the exam measures skills of DevOps Engineers and Automation Specialists and covers building and managing workflows triggered by events such as pushes, scheduled times, manual triggers, and webhooks. It includes understanding workflow components like jobs, steps, actions, and runners, syntax correctness, environment variables, secrets management, and dependencies between jobs. Candidates will also demonstrate practical abilities to create workflows for various purposes, including publishing packages, using service containers, routing jobs, and deploying releases to cloud providers.

100% Pass Quiz Microsoft - The Best GH-200 - Examcollection GitHub Actions Free Dumps

Our GH-200 exam questions provide with the software which has a variety of self-study and self-assessment functions to detect learning results. The statistical reporting function is provided to help students find weak points and deal with them. Our software is also equipped with many new functions, such as timed and simulated test functions. After you set up the simulation test timer with our GH-200 Test Guide which can adjust speed and stay alert, you can devote your mind to learn the knowledge. There is no doubt that the function can help you pass the GH-200 exam.

Microsoft GitHub Actions Sample Questions (Q52-Q57):

NEW QUESTION # 52

In which scenarios could the GITHUB_TOKEN be used? (Choose two.)

- A. to create a repository secret
- B. to read from the file system on the runner
- C. to leverage a self-hosted runner
- D. to add a member to an organization
- E. to create issues in the repo
- F. to publish to GitHub Packages

Answer: E,F

Explanation:

The GITHUB_TOKEN is automatically provided by GitHub in workflows and can be used to authenticate API requests to GitHub, including publishing packages to GitHub Packages.

The GITHUB_TOKEN is also used to authenticate API requests for actions like creating issues, commenting, or interacting with pull requests within the same repository.

NEW QUESTION # 53

Which files are required for a Docker container action in addition to the source code? (Each correct answer presents a partial solution. Choose two.)

- A. metadata.yml
- B. Dockerfile
- C. Actionfile
- D. action.yml

Answer: B,D

Explanation:

Creating a Docker container action

Create a dockerfile

Dockerfile support for GitHub Actions

When creating a Dockerfile for a Docker container action, you should be aware of how some Docker instructions interact with GitHub Actions and an action's metadata file.

Creating an action metadata file

Create a new action.yml file.

<https://docs.github.com/en/actions/reference/workflows-and-actions/dockerfile-support>

NEW QUESTION # 54

As a developer, one of your workflows will require XCode version 11.2 hosted on macOS Catalina (i.e., v10.15). You've already created and configured a self-hosted runner to conform to those requirements and registered it with your organization. What else should you do to ensure that the workflow accesses the correct runner instance? (Each answer presents a complete solution. Choose three.)

- A. In the workflow, specify:
runs-on: [\${{groups.macos-10.15}}, \${{groups.xcode-11.2}}].
- B. Add your runner to the appropriate runner groups.
- C. Create runner groups named macos-10.15 and xcode-11.2.
- D. Create custom runner labels for macos-10.15 and xcode-11.2.
- E. In the workflow, specify:
runs-on: [self-hosted, macos-10.15, xcode-11.2].
- F. Assign the custom labels to the self-hosted runner.

Answer: D,E,F

Explanation:

[C, F] Using custom labels to route jobs

You can create custom labels and assign them to your self-hosted runners at any time. Custom labels let you send jobs to particular types of self-hosted runners, based on how they're labeled.

[E] Using default labels to route jobs

A self-hosted runner automatically receives certain labels when it is added to GitHub Actions.

These are used to indicate its operating system and hardware platform:

self-hosted: Default label applied to self-hosted runners.

linux, windows, or macOS: Applied depending on operating system

x64, ARM, or ARM64: Applied depending on hardware architecture.

You can use your workflow's YAML to send jobs to a combination of these labels. In this example, a self-hosted runner that matches all three labels will be eligible to run the job:

runs-on: [self-hosted, linux, ARM64]

self-hosted - Run this job on a self-hosted runner.

linux - Only use a Linux-based runner.

ARM64 - Only use a runner based on ARM64 hardware.

<https://docs.github.com/en/actions/how-to/manage-runners/self-hosted-runners/use-in-a-workflow>

NEW QUESTION # 55

You are reaching your organization's storage limit for GitHub artifacts and packages. What should you do to prevent the storage limit from being reached?

- A. via the GitHub Marketplace
- B. via a repository owned by a third party
- C. via repositories owned by the organization
- D. via the .github repository owned by the organization

Answer: C

Explanation:

To prevent reaching the storage limit for GitHub artifacts and packages, you should manage and clean up artifacts and packages stored in repositories owned by your organization. This includes deleting unnecessary artifacts and managing the lifecycle of packages, as they contribute directly to your organization's storage quota.

NEW QUESTION # 56

As a developer, which workflow steps should you perform to publish an image to the GitHub Container Registry? (Each correct answer represents part of the solution. Choose three).

- A. Authenticate to the GitHub Container Registry.
- B. Push the image to the GitHub Container Registry.
- C. Use the actions/setup-docker action.
- D. Build the container image.
- E. Pull the image from the GitHub Container Registry.

Answer: A,B,D

Explanation:

Publishing Docker images

The below workflow checks out the GitHub repository, uses the login-action to log in to the registry [B], and then uses the build-push-action to: build a Docker image based on your repository's Dockerfile [E]; push the image to Docker Hub [A], and apply a tag to the image.

Note:

This workflow uses actions that are not certified by GitHub.

They are provided by a third-party and are governed by

separate terms of service, privacy policy, and support

documentation.

GitHub recommends pinning actions to a commit SHA.

To get a newer version, you will need to update the SHA.

You can also reference a tag or branch, but the action may change without warning.
