Identity-and-Access-Management-Architect Simulations Pdf | Latest Identity-and-Access-Management-Architect Exam Camp

The exam will be vanquished smoothly this time by the help of valid latest Identity-and-Access-Management-Architect exam torrent. Written by meticulous and professional experts in this area, their quality has reached to the highest level compared with others' similar Identity-and-Access-Management-Architect test prep and concord with the syllabus of the exam perfectly. Their questions points provide you with simulation environment to practice. In that case, when you sit in the Real Identity-and-Access-Management-Architect Exam room, you can deal with almost every question with ease.

To prepare for Identity-and-Access-Management-Architect Exam, candidates should have a solid understanding of Salesforce's identity and access management solutions, including Single Sign-On (SSO), Identity Provider (IdP), and Security Assertion Markup Language (SAML). They should also have experience with data security and compliance, and be familiar with industry best practices for identity and access management.

Salesforce Certified Identity and Access Management Architect Sample Questions (Q158-Q163):

NEW QUESTION # 158

Universal Containers (UC) is looking to build a Canvas app and wants to use the corresponding Connected App to control where the app is visible. Which two options are correct in regards to where the app can be made visible under the Connected App setting for the Canvas app? Choose 2 answers

- A. As part of the body of a Salesforce Knowledge article.
- B. In the mobile navigation menu on Salesforce for Android.
- C. Included in the Call Control Tool that's part of Open CTI.
- D. The sidebar of a Salesforce Console as a console component.

Answer: C,D

Explanation:

The sidebar of a Salesforce Console as a console component and included in the Call Control Tool that's part of Open CTI are two options that are correct in regards to where the app can be made visible under the connected app settings for the Canvas app. A Canvas app is an external application that can be embedded within Salesforce using an iframe. A connected app is an application that integrates with Salesforce using APIs and uses OAuth as the authentication protocol. You can control where a Canvas app can be displayed in Salesforce by configuring the locations in the connected app settings. The sidebar of a Salesforce Console as a console component is a valid location for a Canvas app because it allows you to display the app as a collapsible panel on the side of any console app. Included in the Call Control Tool that's part of Open CTI is a valid location for a Canvas app because it allows you to display the app as part of the softphone panel that integrates with your telephony system. As part of the body of a Salesforce Knowledge article is not a valid location for a Canvas app because it is not supported by the connected app settings. In the mobile navigation menu on Salesforce for Android is not a valid location for a Canvas app because it is not supported by the connected app settings. NEW QUESTION # 159

Northern Trail Outfitters (NTO) is planning to build a new customer service portal and wants to use passwordless login, allowing customers to login with a one-time passcode sent to them via email or SMS.

How should the quantity of required Identity Verification Credits be estimated?

- A. Identity Verification Credits are a direct add-on license based on the number of existing member-based or login-based Community licenses.
- B. Identity Verification Credits are consumed with each SMS (text message) sent and should be estimated based on the number of login verification challenges for SMS verification users.
- C. Each community comes with 10,000 Identity Verification Credits per month and only customers with more than 10,000 logins a month should estimate additional SMS verifications needed.
- D. Identity Verification Credits are consumed with each verification sent and should be estimated based on the number of logins that will incur a verification challenge.

Answer: B

Explanation:

Explanation

Identity Verification Credits are units that are consumed when Salesforce sends verification messages to users via email or SMS. To use passwordless login, customers need to receive a one-time passcode via email or SMS that they can use to log in to the customer service portal. Therefore, Identity Verification Credits are consumed with each SMS (text message) sent and should be estimated based on the number of login verification challenges for SMS verification users. Email verification does not consume Identity Verification Credits. References: Identity Verification Credits, Passwordless Login

NEW QUESTION # 160

Universal Containers (UC) has a Customer Community that uses Facebook for authentication. UC would like to ensure that changes in the Facebook profile are reflected on the appropriate Customer Community user. How can this requirement be met?

- A. Develop a scheduled job that calls out to Facebook on a nightly basis.

- B. Use information in the Signed Request that is received from Facebook.
- **C. Use the update User () method on the Registration Handler class.**
- D. Use SAML Just-In-Time Provisioning between Facebook and Salesforce.

Answer: C

Explanation:

The update User() method on the Registration Handler class is used to update the Salesforce user record with information from the Facebook profile, such as name, email, and photo¹. This method is invoked every time a user logs in to Salesforce using Facebook credentials². The other options are not suitable for this requirement because:

* SAML Just-In-Time Provisioning is used to create or update users in Salesforce based on SAML assertions from an identity provider³. Facebook does not support SAML as an identity provider.

* The Signed Request is a parameter that contains information about the user who is logging in to Salesforce via Facebook. It does not contain the user's profile information, such as name, email, or photo.

* A scheduled job that calls out to Facebook on a nightly basis would not reflect the changes in the Facebook profile in real time, as the requirement states. It would also require storing the user's Facebook access token and making API calls to Facebook, which could be inefficient and insecure.

NEW QUESTION # 161

Universal Containers (UC) has a classified information system that its call centre team uses only when they are working on a case with a record type of "classified". They are only allowed to access the system when they own an open "classified" case, and their access to the system is removed at all other times. They would like to implement SAML SSO with Salesforce as the IDP, and automatically allow or deny the staff's access to the classified information system based on whether they currently own an open "classified" case record when they try to access the system using SSO. What is the recommended solution for automatically allowing or denying access to the classified information system based on the open "classified" case record criteria?

- **A. Use a custom connected App handler using apex to dynamically allow access to the system based on whether the staff owns any open "classified" cases.**
- B. Use Salesforce reports to identify users that currently own open "classified" cases and should be granted access to the classified information system.
- C. Use Apex trigger on case to dynamically assign permission sets that grant access when a user is assigned with an open "classified" case, and remove it when the case is closed.
- D. Use custom SAML JIT provisioning to dynamically query the user's open "classified" cases when attempting to access the classified information system.

Answer: A

Explanation:

Explanation

Use a custom connected app handler using Apex to dynamically allow access to the system based on whether the staff owns any open "classified" cases is the recommended solution for this scenario. A custom connected app handler is an Apex class that implements the ConnectedAppPlugin interface and can customize the behavior of a connected app. The custom handler can support new protocols or respond to user attributes in a way that benefits a business process. In this case, the custom handler can query the user's open "classified" cases and grant or deny access to the classified information system accordingly. Use Apex trigger on case to dynamically assign permission sets that grant access when a user is assigned with an open "classified" case, and remove it when the case is closed is not a good solution, as permission sets are not related to SSO and cannot control access to external systems. Use custom SAML JIT provisioning to dynamically query the user's open "classified" cases when attempting to access the classified information system is not feasible, as JIT provisioning is used to create or update user records in Salesforce, not in external systems. Use Salesforce reports to identify users that currently own open "classified" cases and should be granted access to the classified information system is not an automated solution, as it requires manual intervention and does not leverage SSO.

NEW QUESTION # 162

Universal Containers (UC) is both a Salesforce and Google Apps customer. The UC IT team would like to manage the users for both systems in a single place to reduce administrative burden. Which two optimal ways can the IT team provision users and allow

Single Sign-on between Salesforce and Google Apps ? Choose 2 answers

- A. Build a custom app running on Heroku as the Identity Provider that can sync user information between Salesforce and Google Apps.
- **B. Use a third-party product as the Identity Provider for both Salesforce and Google Apps and manage the provisioning from there.**
- C. Use Identity Connect as the Identity Provider for both Salesforce and Google Apps and manage the provisioning from there.
- **D. Use Salesforce as the Identity Provider and Google Apps as a Service Provider and configure User Provisioning for Connected Apps.**

Answer: B,D

Explanation:

B is correct because a third-party product can act as an Identity Provider (IdP) for both Salesforce and Google Apps and manage the user provisioning from a single place¹². This reduces the administrative burden and provides a consistent user experience.

D is correct because Salesforce can act as an IdP and Google Apps can act as a Service Provider (SP) and they can use SAML or OpenID Connect for Single Sign-on (SSO)³⁴. Salesforce also supports User Provisioning for Connected Apps, which allows the creation, update, and deactivation of users in Google Apps based on changes in Salesforce.

A is incorrect because building a custom app on Heroku as an IdP is not an optimal way to provision users and allow SSO. It would require more development and maintenance effort than using a third-party product or Salesforce as an IdP.

C is incorrect because Identity Connect is a tool that synchronizes users between Active Directory and Salesforce. It does not support Google Apps as a target system for user provisioning or SSO.
