## Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q160-Q165):

### NEW QUESTION # 160

A company is planning on deploying a newly built application on AWS in a default VPC. The application will consist of a web layer and database layer. The web server was created in public subnets, and the MySQL database was created in private subnets. All subnets are created with the default network ACL settings, and the default security group in the VPC will be replaced with new custom security groups.

The following are the key requirements:

- \* The web servers must be accessible only to users on an SSL connection.
- \* The database should be accessible to the web layer, which is created in a public subnet only.

\* All traffic to and from the IP range 182.20.0.0/16 subnet should be blocked.

Which combination of steps meets these requirements? (Select two.)

- A. Create a database server security group with inbound and outbound rules for MySQL port 3306 traffic to and from anywhere (0.0.0.0/0).
- **B. Create a web server security group with an inbound rule for HTTPS port 443 traffic from anywhere (0.0.0.0/0). Create network ACL inbound and outbound deny rules for IP range 182.20.0.0/16.**
- C. Create a web server security group with inbound and outbound rules for HTTPS port 443 traffic to and from anywhere (0.0.0.0/0). Create a network ACL inbound deny rule for IP range 182.20.0.0/16.
- **D. Create a database server security group with an inbound rule for MySQL port 3306 and specify the source as a web server security group.**
- E. Create a web server security group with an inbound allow rule for HTTPS port 443 traffic from anywhere (0.0.0.0/0) and an inbound deny rule for IP range 182.20.0.0/16.

**Answer: B,D**

#### NEW QUESTION # 161

An organization runs an online media site, hosted on-premises. An employee posted a product review that contained videos and pictures. The review went viral and the organization needs to handle the resulting spike in website traffic.

What action would provide an immediate solution?

- A. Add server instances using Amazon EC2 and use Amazon Route 53 with a failover routing policy.
- **B. Serve the images and videos via an Amazon CloudFront distribution created using the news site as the origin.**
- C. Redesign the website to use Amazon API Gateway, and use AWS Lambda to deliver content.
- D. Use Amazon ElasticCache for Redis for caching and reducing the load requests from the origin.

**Answer: B**

#### NEW QUESTION # 162

A company has deployed resources in the us-east-1 Region. The company also uses thousands of AWS Outposts servers deployed at remote locations around the world. These Outposts servers regularly download new software versions from us-east-1 that consist of hundreds of files. The company wants to improve the latency of the software download process.

Which solution will meet these requirements?

- **A. Create an Amazon S3 bucket in us-east-1. Set up a CloudFront distribution using all edge locations with caching enabled. Configure the bucket as the origin. Download the software by using signed URLs.**
- B. Create an Amazon S3 bucket in us-east-1. Configure the bucket for static website hosting. Use bucket policies and ACLs to provide read access to the Outposts servers.
- C. Create an Amazon S3 bucket in us-east-1. Configure S3 Transfer Acceleration. Configure the Outposts servers to download by using the acceleration endpoint.
- D. Create an Amazon S3 bucket in us-east-1 and a second bucket in us-west-2. Configure replication. Set up a CloudFront distribution with origin failover between the buckets. Download by using signed URLs.

**Answer: A**

Explanation:

Amazon CloudFront uses a globally distributed network of edge locations that cache content close to users.

When Outposts servers around the world download large software packages, CloudFront provides significantly reduced latency due to edge caching. This is the AWS-recommended solution for accelerating downloads of static files at scale and across global locations.

S3 Transfer Acceleration optimizes uploads and downloads to a single Region but does not provide edge caching. Multi-Region replication with failover does not reduce latency globally because requests still must reach the regional origins. Therefore, CloudFront with caching enabled is the correct design for improving download speed worldwide.

#### NEW QUESTION # 163

An application server needs to be in a private subnet without access to the Internet. The solution must retrieve and upload files to an Amazon S3 bucket.

How should a Solutions Architect design a solution to meet these requirements?

- A. Use a private Amazon S3 bucket
- **B. Use Amazon S3 VPC endpoints**
- C. Use a NAT Gateway
- D. Deploy a proxy server

**Answer: B**

#### NEW QUESTION # 164

A company is using Amazon EC2 to run its big data analytics workloads. These variable workloads run each night, and it is critical they finish by the start of business the following day. A solutions architect has been tasked with designing the MOST cost-effective solution.

Which solution will accomplish this?

- A. Reserved Instances
- B. On-Demand Instances
- C. Spot Instances
- **D. Spot Fleet**

**Answer: D**
