This is a good way to purchase valid exam preparation materials for your coming CCDAK test. Good choice will make you get double results with half efforts. Good exam preparation will point you a clear direction and help you prepare efficiently. Our CCDAK exam preparation can not only give a right direction but also cover most of the real test questions so that you can know the content of exam in advance. You can master the questions and answers of Confluent CCDAK Exam Preparation, even adjust your exam mood actively.

Confluent Certified Developer for Apache Kafka (CCDAK) Certification Examination is a valuable credential for developers who work with Apache Kafka. It is an excellent way to demonstrate knowledge and expertise in Apache Kafka, and to differentiate oneself from the competition. Confluent Certified Developer for Apache Kafka Certification Examination certification is highly regarded by employers and industry professionals, and can help professionals stay current with the latest trends and developments in the industry.

Quiz Confluent - CCDAK - Efficient Confluent Certified Developer for Apache Kafka Certification Examination Reliable Exam Book

Confluent CCDAK certification can guarantee you have good job prospects, because Confluent certification CCDAK exam is a

difficult test of IT knowledge, passing Confluent Certification CCDAK Exam proves that your IT expertise is strong and you can be qualified for a good job.

Confluent Certified Developer for Apache Kafka Certification Examination (CCDAK) is a technical certification exam designed for Kafka developers. The Kafka platform has gained immense popularity in recent years, and organizations worldwide are seeking professionals with expertise in this technology. The CCDAK Exam is designed to test a developer's understanding of Kafka fundamentals, architecture, and its application in real-world scenarios.

Confluent Certified Developer for Apache Kafka Certification Examination Sample Questions (Q70-Q75):

NEW QUESTION # 70

Which KSQL queries write to Kafka?

- A. CREATE STREAM WITH <topic> and CREATE TABLE WITH <topic>
- B. COUNT and JOIN
- C. SHOW STREAMS and EXPLAIN <query> statements
- D. CREATE STREAM AS SELECT and CREATE TABLE AS SELECT

Answer: A,D

Explanation:

SHOW STREAMS and EXPLAIN <query> statements run against the KSQL server that the KSQL client is connected to. They don't communicate directly with Kafka. CREATE STREAM WITH <topic> and CREATE TABLE WITH <topic> write metadata to the KSQL command topic. Persistent queries based on CREATE STREAM AS SELECT and CREATE TABLE AS SELECT read and write to Kafka topics.

Non-persistent queries based on SELECT that are stateless only read from Kafka topics, for example:

```
SELECT A FROM foo WHERE A;
```

Non-persistent queries that are stateful read and write to Kafka, for example, COUNT and JOIN. The data in Kafka is deleted automatically when you terminate the query with CTRL-C.

NEW QUESTION # 71

(Which configuration is valid for deploying a JDBC Source Connector to read all rows from the orders table and write them to the dbl-orders topic?)

- A. `{ "name": "jdbc-source", "connector.class": "io.confluent.connect.jdbc.JdbcSourceConnector", "tasks.max": "1", "connection.url": "jdbc:mysql://mysql3306/dbl?user=user&password=pas", "topic.prefix": "dbl-", "table.whitelist": "orders" }`
- B. `{ "name": "jdbc-source", "connector.class": "io.confluent.connect.jdbc.DdbcSourceConnector", "tasks.max": "1", "connection.url": "jdbc:mysql://mysql3306/dbl?user=user&useAutoAuth=true", "topic.prefix": "dbl-", "table.whitelist": "orders" }`
- C. `{ "name": "dbl-orders", "connector.class": "io.confluent.connect.jdbc.DdbcSourceConnector", "tasks.max": "1", "connection.url": "jdbc:mysql://mysql3306/dbl?user=user&password=pas", "topic.prefix": "dbl-", "table.blacklist": "ord*" }`
- D. `{ "name": "orders-connect", "connector.class": "io.confluent.connect.jdbc.DdbcSourceConnector", "tasks.max": "1", "connection.url": "jdbc:mysql://mysql3306/dbl", "topic.whitelist": "orders", "auto.create": "true" }`

Answer: A

Explanation:

According to the official Apache Kafka Connect and Confluent JDBC Source Connector documentation, the correct connector class for a JDBC source connector is `io.confluent.connect.jdbc.JdbcSourceConnector`. This connector is used to read data from relational databases and publish each table as a Kafka topic.

To read all rows from a specific table, the configuration must include `table.whitelist` (or `table.include.list` in newer versions) with the table name, and a `topic.prefix` to determine the Kafka topic name. In this case, using `topic.prefix=dbl-` with `table.whitelist=orders` results in records being written to the `dbl-orders` topic, which matches the requirement.

Options A, B, and C are invalid because they reference a non-existent connector class (`DdbcSourceConnector`), contain unsupported properties such as `topic.whitelist` for a source connector, or include malformed/incorrect JDBC parameters.

Additionally, blacklisting tables does not ensure that only the orders table is read.

Therefore, option D is the only configuration that is syntactically correct, uses the proper connector class, and aligns with the official Kafka Connect JDBC Source Connector documentation.

NEW QUESTION # 72

Where are the ACLs stored in a Kafka cluster by default?

- A. Under Zookeeper node /kafka-acl/
- B. Inside the Zookeeper's data directory
- C. Inside the broker's data directory
- D. In Kafka topic __kafka_acls

Answer: C

Explanation:

ACLs are stored in Zookeeper node /kafka-acls/ by default.

NEW QUESTION # 73

Once sent to a topic, a message can be modified

- A. Yes
- B. No

Answer: B

Explanation:

Kafka logs are append-only and the data is immutable

NEW QUESTION # 74

(You deploy a Kafka Streams application with five application instances.

Kafka Streams stores application metadata using internal topics.

Auto-topic creation is disabled in the Kafka cluster.

Which statement about this scenario is true?)

- A. The application will continue to work and internal topics will be created, even if auto-topic creation is disabled.
- B. The application will be on hold until internal topics are created manually.
- C. The application will terminate with a non-retriable exception.
- D. The application will work, but application metadata will not be stored.

Answer: C

Explanation:

According to the official Apache Kafka Streams documentation, Kafka Streams relies on internal topics (such as changelog topics and repartition topics) to store state, task assignments, and application metadata. These topics are essential for fault tolerance, rebalancing, and state recovery.

When auto-topic creation is disabled, Kafka Streams cannot automatically create the required internal topics unless they already exist. In this situation, the Streams application will fail during startup with a fatal, non-retriable exception, indicating that the necessary internal topics could not be created.

Kafka Streams does not pause or wait for manual topic creation, nor does it operate without storing metadata.

Instead, it explicitly requires these topics to exist or be creatable. While administrators can manually pre-create the required internal topics with the correct configuration, failure to do so causes the application to terminate.

Therefore, the correct and documented behavior is that the Kafka Streams application terminates with a non-retriable exception when auto-topic creation is disabled and required internal topics are missing.
