## CompTIA A+ Certification Exam: Core 2 Sample Questions (Q558-Q563):

### NEW QUESTION # 558

Which of the following security methods supports the majority of current Wi-Fi-capable devices without sacrificing security?

- A. TACACS+
- B. MAC filleting
- C. WPA3
- D. RADIUS

Answer: C

Explanation:

WPA3 (Wi-Fi Protected Access 3) is a wireless security method that supports the majority of current Wi-Fi- capable devices without sacrificing security. It is backward compatible with WPA2 devices and offers enhanced encryption and authentication features. MAC filtering is another wireless security method, but it can be easily bypassed by spoofing MAC addresses. RADIUS (Remote Authentication Dial-In User Service) and TACACS+ (Terminal Access Controller Access-Control System Plus) are network authentication protocols, but they are not wireless security methods by themselves. #### NEW QUESTION # 561

A remote user's smartphone is performing very slowly. The user notices that the performance improves slightly after rebooting but then reverts back to performing slowly. The user also notices that the phone does not get any faster after connecting to the company's corporate guest network. A technician sees that the phone has a large number of applications installed on it. Which of the following is the most likely cause of the issue?

- A. The user is in a poor signal area.
- B. The smartphone has been jailbroken.
- **C. The user has too many processes running.**
- D. The smartphone has malware on it.

**Answer: C**

Explanation:

One of the common reasons for a slow smartphone performance is having too many apps installed and running in the background. These apps consume the device's memory (RAM) and CPU resources, which can affect the speed and responsiveness of the phone. Rebooting the phone can temporarily clear the RAM and stop some background processes, but they may resume after a while. Connecting to a different network does not affect the performance of the phone, unless the network is congested or has a poor signal. The user can improve the phone's performance by uninstalling unused apps, clearing app caches, and restricting background activities<sup>12</sup>. Malware can also slow down a phone, but it is not the most likely cause in this scenario, as the user does not report any other symptoms of infection, such as pop-ups, battery drain, or data usage spikes<sup>3</sup>.

Jailbreaking a phone can also affect its performance, but it is not a cause, rather a consequence, of the user's actions. Jailbreaking is the process of removing the manufacturer's restrictions on a phone, which allows the user to install unauthorized apps, customize the system, and access root privileges<sup>4</sup>. However, jailbreaking also exposes the phone to security risks, voids the warranty, and may cause instability or compatibility issues<sup>5</sup>.

### NEW QUESTION # 562

Which of The following refers to the steps to be taken if an Issue occurs during a change Implementation?

- A. Risk
- **B. Rollback**
- C. Acceptance
- D. Testing

**Answer: B**

Explanation:

Rollback refers to the steps to be taken if an issue occurs during a change implementation. It means restoring the system to its previous state before the change was applied, using backup data or configuration files. It can minimize the impact and downtime caused by a failed change. Testing refers to the steps to be taken before a change implementation, to verify that the change works as expected and does not cause any errors or conflicts. Risk refers to the potential negative consequences of a change implementation, such as data loss, security breach, performance degradation, etc. Acceptance refers to the steps to be taken after a change implementation, to confirm that the change meets the requirements and expectations of the stakeholders.
