Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q185-Q190):

NEW QUESTION # 185

A company provides an API to its users that automates inquiries for tax computations based on item prices.

The company experiences a larger number of inquiries during the holiday season only that cause slower response times. A solutions architect needs to design a solution that is scalable and elastic. What should the solutions architect do to accomplish this?

- A. Design a REST API using Amazon API Gateway that accepts the item names. API Gateway passes item names to AWS Lambda for tax computations
- B. Design a REST API using Amazon API Gateway that connects with an API hosted on an Amazon EC2 instance. API Gateway accepts and passes the item names to the EC2 instance for tax computations
- C. Create an Application Load Balancer that has two Amazon EC2 instances behind it. The EC2 instances will compute the tax on the received item names.
- D. Provide an API hosted on an Amazon EC2 instance. The EC2 instance performs the required computations when the API request is made.

Answer: B

NEW QUESTION # 186

A solution architect needs to design a highly available application consisting of web, application, and database tiers. HTTPS content delivery should be as close to the edge as possible, with the least delivery time.

Which solution meets these requirements and is MOST secure?

- A. Configure a public Application Load Balancer (ALB) with multiple redundant Amazon EC2 instances in private subnets. Configure Amazon CloudFront to deliver HTTPS content using the public ALB as the origin
- B. Configure a public Application Load Balancer with multiple redundant Amazon EC2 instances in public subnets. Configure Amazon CloudFront to deliver HTTPS content using the EC2 instances as the origin
- C. Configure a public Application Load Balancer (ALB) with multiple redundant Amazon EC2 instances in public subnets. Configure Amazon CloudFront to deliver HTTPS content using the public ALB as the origin
- D. Amazon EC2 instances in private subnets. Configure a public Application Load Balancer with multiple redundant Amazon CloudFront to deliver HTTPS content using the EC2 instances as the origin.

Answer: D

NEW QUESTION # 187

When using consolidated billing there are two account types. What are they?

- A. Parent account and Child account
- B. Paying account and Linked account
- C. Main account and Secondary account.
- D. Main account and Sub account.

Answer: B

NEW QUESTION # 188

A Solutions Architect is designing a feature for internal-facing employees of a call center that permits users to toggle their availability to take a call. This feature should be available through a link found in the call center support application. When a user signals their availability, the call center manager receives an SMS and a status board should update with the user's availability.

Which combination of AWS services can satisfy this need?

- A. Lambda, API gateway, DynamoDB, Amazon SNS, and Amazon S3
- B. Amazon EC2, Amazon DynamoDB, Amazon SQS, Amazon API Gateway, and Amazon S3

- C. Amazon EC2, API Gateway, AWS Elastic Beanstalk, DynamoDB, and Amazon S3
- D. Lambda, Amazon SQS, DynamoDB, API Gateway, and Amazon S3

Answer: A

NEW QUESTION # 189

A company currently operates a web application backed by an Amazon RDS MySQL database. It has automated backups that are run daily and are not encrypted. A security audit requires future backups to be encrypted and the unencrypted backups to be destroyed. The company will make at least one encrypted backup before destroying the old backups. What should be done to enable encryption for future backups?"

- A. Enable default encryption for the Amazon S3 bucket where backups are stored
- B. Create a snapshot of the database Copy it to an encrypted snapshot Restore the database from the encrypted snapshot
- C. Enable an encrypted read replica on RDS for MySQL Promote the encrypted read replica to primary Remove the original database instance
- D. Modify the backup section of the database configuration to toggle the Enable encryption check box

Answer: B

Explanation:

Explanation

However, because you can encrypt a copy of an unencrypted DB snapshot, you can effectively add encryption to an unencrypted DB instance. That is, you can create a snapshot of your DB instance, and then create an encrypted copy of that snapshot. You can then restore a DB instance from the encrypted snapshot, and thus you have an encrypted copy of your original DB instance. DB instances that are encrypted can't be modified to disable encryption.

You can't have an encrypted read replica of an unencrypted DB instance or an unencrypted read replica of an encrypted DB instance.

Encrypted read replicas must be encrypted with the same key as the source DB instance when both are in the same AWS Region. You can't restore an unencrypted backup or snapshot to an encrypted DB instance.

To copy an encrypted snapshot from one AWS Region to another, you must specify the KMS key identifier of the destination AWS Region. This is because KMS encryption keys are specific to the AWS Region that they are created in.
