The Splunk Enterprise Certified Architect (SPLK-2002) certification is a valuable credential that every Splunk professional should earn it. The SPLK-2002 certification exam offers a great opportunity for beginners and experienced professionals to demonstrate their expertise. With the Splunk Enterprise Certified Architect (SPLK-2002) certification exam everyone can upgrade their skills and knowledge. There are other several benefits that the Splunk SPLK-2002 exam holders can achieve after the success of the Splunk Enterprise Certified Architect (SPLK-2002) certification exam.

If you want to give up your certificate exams as you fail SPLK-2002 exam or feel it too difficult, please think about its advantages after you obtain a Splunk certification. Many special positions require employees to have a qualification. If you think it is very difficult for you to pass exams, our SPLK-2002 Valid Exam Cram PDF can help you to achieve your goal. Our exam materials are collected from the real test center and edited by our experienced experts. If you need 100% passing rate, our SPLK-2002 valid exam cram PDF can help you.

Exam SPLK-2002 Reference, Exam SPLK-2002 Bible

The exam requires an enormous amount of effort and determination and dedication to get to the end goal. Fast2test is one of the most reliable platforms that offer an accurate, reliable, and straightforward Splunk SPLK-2002 dumps to ensure the success of students on the initial try. Fast2test offers the complete package that includes all exam dumps conforming to the syllabus for passing the Splunk Enterprise Certified Architect (SPLK-2002) exam certificate in the first try.

Splunk Enterprise Certified Architect Sample Questions (Q149-Q154):

NEW QUESTION # 149

In the deployment planning process, when should a person identify who gets to see network data?

- A. Deployment schedule
- B. Data policy definition
- C. Topology diagramming
- **D. Data source inventory**

Answer: D

NEW QUESTION # 150

Which of the following will cause the greatest reduction in disk size requirements for a cluster of N indexers running Splunk Enterprise Security?

- A. Setting the cluster search factor to N-1.
- **B. Decreasing the data model acceleration range.**
- C. Setting the cluster replication factor to N-1.
- D. Increasing the number of buckets per index.

Answer: B

Explanation:

Explanation

Decreasing the data model acceleration range will reduce the disk size requirements for a cluster of indexers running Splunk Enterprise Security. Data model acceleration creates tsidx files that consume disk space on the indexers. Reducing the acceleration range will limit the amount of data that is accelerated and thus save disk space. Setting the cluster search factor or replication factor to N-1 will not reduce the disk size requirements, but rather increase the risk of data loss. Increasing the number of buckets per index will also increase the disk size requirements, as each bucket has a minimum size. For more information, see Data model acceleration and Bucket size in the Splunk documentation.

NEW QUESTION # 151

When adding or decommissioning a member from a Search Head Cluster (SHC), what is the proper order of operations?

- A. 1. Trigger replication.2. Remove master node from cluster.3. Initialize cluster rebalance operation.
- B. 1. Initialize cluster rebalance operation.2. Remove master node from cluster.3. Trigger replication.
- **C. 1. Delete Splunk Enterprise, if it exists.2. Install and initialize the instance.3. Join the SHC.**
- D. 1. Install and initialize the instance.2. Delete Splunk Enterprise, if it exists.3. Join the SHC.

Answer: C

Explanation:

When adding or decommissioning a member from a Search Head Cluster (SHC), the proper order of operations is:

* Delete Splunk Enterprise, if it exists.

* Install and initialize the instance.

* Join the SHC.

This order of operations ensures that the member has a clean and consistent Splunk installation before joining the SHC. Deleting Splunk Enterprise removes any existing configurations and data from the instance.

Installing and initializing the instance sets up the Splunk software and the required roles and settings for the SHC. Joining the SHC adds the instance to the cluster and synchronizes the configurations and apps with the other members. The other order of operations are not correct, because they either skip a step or perform the steps in the wrong order.

NEW QUESTION # 152

Which of the following statements describe licensing in a clustered Splunk deployment? (Select all that apply.)

- A. Cluster members must share the same license pool and license master.
- B. Each cluster member requires its own clustering license.
- C. Free licenses do not support clustering.
- D. Replicated data does not count against licensing.

Answer: A,D

Explanation:

Explanation/Reference: <https://docs.splunk.com/Documentation/Splunk/7.3.2/Admin/Distdeploylicenses>

NEW QUESTION # 153

(On which Splunk components does the Splunk App for Enterprise Security place the most load?)

- A. Cluster Managers
- B. Indexers
- C. Search Heads
- D. Heavy Forwarders

Answer: C

Explanation:

According to Splunk's Enterprise Security (ES) Installation and Sizing Guide, the majority of processing and computational load generated by the Splunk App for Enterprise Security is concentrated on the Search Head (s).

This is because Splunk ES is built around a search-driven correlation model - it continuously runs scheduled correlation searches, data model accelerations, and notables generation jobs. These operations rely on the search head tier's CPU, memory, and I/O resources rather than on indexers. ES also performs extensive data model summarization, CIM normalization, and real-time alerting, all of which are search-intensive operations.

While indexers handle data ingestion and indexing, they are not heavily affected by ES beyond normal search request processing. The Cluster Manager only coordinates replication and plays no role in search execution, and Heavy Forwarders serve as data collection or parsing points with minimal analytical load.

Splunk officially recommends deploying ES on a dedicated Search Head Cluster (SHC) to isolate its high CPU and memory demands from other workloads. For large-scale environments, horizontal scaling via SHC ensures consistent performance and stability.
