

Pass Amazon DVA-C02 Exam Easily With Questions And Answers

BONUS!!! Download part of Free4Torrent DVA-C02 dumps for free: https://drive.google.com/open?id=1pZ0aSNDOpZLEUFhXmusk4Qv_PKe0vD

The learners' learning conditions are varied and many of them may have no access to the internet to learn our DVA-C02 study materials. If the learners leave home or their companies they can't link the internet to learn our DVA-C02 study materials. But you use our APP online version you can learn offline. If only you use the DVA-C02 study materials in the environment of being online for the first time you can use them offline later. So it will be very convenient for every learner because they won't worry about when they go out or go to the remote area that they can't link the internet to learn our DVA-C02 Study Materials, and they can use our APP online version to learn at any place or time. That's the great merit of our APP online version and the learners who have difficulties in linking the internet outside their homes or companies can utilize this advantage, they can learn our DVA-C02 study materials at any place.

Amazon DVA-C02 exam covers a wide range of AWS services and concepts, including AWS Lambda, AWS Elastic Beanstalk, AWS DynamoDB, AWS Simple Queue Service (SQS), and AWS Simple Notification Service (SNS). DVA-C02 exam also tests a candidate's knowledge of AWS security and compliance, cost optimization, and troubleshooting. DVA-C02 exam consists of 65 multiple-choice and multiple-response questions and must be completed within 130 minutes.

Passing the Amazon DVA-C02 exam is a great way for software developers to demonstrate their expertise in developing applications on the AWS platform. AWS Certified Developer - Associate certification can open up many career opportunities in the field of cloud computing, as more and more companies are moving their applications to the cloud. It can also help developers

increase their earning potential, as AWS Certified Developers - Associates are in high demand and can command higher salaries than their non-certified peers.

Amazon DVA-C02 (AWS Certified Developer - Associate) Exam is a certification exam that is designed to test the knowledge and skills of individuals who are interested in becoming AWS Certified Developers. DVA-C02 exam is ideal for developers who have experience in developing and maintaining applications on the AWS platform. DVA-C02 exam assesses the candidate's ability to design, develop, and deploy cloud-based solutions using AWS services and tools.

Free PDF 2026 Amazon High Hit-Rate DVA-C02 Exam Brain Dumps

Although it is difficult for you to prepare for DVA-C02 exam, once you obtain the targeted exam certification, you will have a vast development prospects in IT industry. So what we can do is to help you not waste your efforts on the exam preparation. The Reliability and authority of DVA-C02 Exam software on our Free4Torrent has been recognized by majority of our customers, which will be found when you download our free demo. We will try our best to help you pass DVA-C02 exam successfully.

Amazon AWS Certified Developer - Associate Sample Questions (Q489-Q494):

NEW QUESTION # 489

A company regularly receives route status updates from its delivery trucks as events in Amazon EventBridge. The company is building an API-based application in a VPC that will consume and process the events to create a delivery status dashboard. The API application must not be available by using public IP addresses because of security and compliance requirements.

How should the company send events from EventBridge to the API application?

- A. Create an internet-facing Application Load Balancer (ALB) in front of the API application. Associate a security group with rules that block access from all external sources except for EventBridge. Configure the ALB as an EventBridge target.
- B. Create an internet-facing Network Load Balancer (NLB) in front of the API application. Associate a security group with rules that block access from all external sources except for EventBridge. Configure the NLB as an EventBridge target.
- C. Use the application API endpoint in the VPC as a target for EventBridge. Send events directly to the application API endpoint from EventBridge.
- D. Create an AWS Lambda function that runs in the same VPC as the API application. Configure the function as an EventBridge target. Use the function to send events to the API.

Answer: D

Explanation:

Comprehensive Detailed Explanation with all AWS References

* Why Option A is Correct: Running an AWS Lambda function within the same VPC ensures secure communication without exposing the API application to public IP addresses. The Lambda function can serve as a secure EventBridge target to send events to the API.

* Why Other Options are Incorrect:

* Option B & C: Internet-facing load balancers expose public IP addresses, which violates compliance requirements.

* Option D: EventBridge cannot directly target an endpoint within a private VPC without intermediary services like Lambda.

* AWS Documentation References:

* EventBridge Targets

NEW QUESTION # 490

A developer is building an application on AWS. The application includes an AWS Lambda function that processes messages from an Amazon Simple Queue Service (Amazon SQS) queue.

The Lambda function sometimes fails or times out. The developer needs to figure out why the Lambda function fails to process some messages.

Which solution will meet these requirements with the LEAST operational overhead?

- A. Increase the maximum timeout of the Lambda function to 15 minutes. Check the AWS CloudTrail event history for error details.

- B. Create an Amazon DynamoDB table. Update the Lambda function to send the failed messages to the DynamoDB table.
- **C. Increase the visibility timeout of the SQS queue. Check logs in Amazon CloudWatch Logs for error details.**
- D. Create a dead-letter queue. Configure the Lambda function to send the failed messages to the dead-letter queue.

Answer: C

NEW QUESTION # 491

A developer needs to use Amazon DynamoDB to store customer orders. The developer's company requires all customer data to be encrypted at rest with a key that the company generates.

What should the developer do to meet these requirements?

- A. Store the key by using AWS Key Management Service (AWS KMS). Create the DynamoDB table with default encryption. Include the kms:Encrypt parameter with the Amazon Resource Name (ARN) of the AWS KMS key when using the DynamoDB software development kit (SDK).
- B. Store the key by using AWS Key Management Service (AWS KMS). Choose an AWS KMS AWS managed key during creation of the DynamoDB table. Provide the Amazon Resource Name (ARN) of the AWS KMS key.
- C. Create the DynamoDB table with encryption set to None. Code the application to use the key to decrypt the data when the application reads from the table. Code the application to use the key to encrypt the data when the application writes to the table.
- **D. Store the key by using AWS Key Management Service (AWS KMS). Choose an AWS KMS customer managed key during creation of the DynamoDB table. Provide the Amazon Resource Name (ARN) of the AWS KMS key.**

Answer: D

NEW QUESTION # 492

A company is developing an application that will be accessed through the Amazon API Gateway REST API. Registered users should be the only ones who can access certain resources of this API. The token being used should expire automatically and needs to be refreshed periodically.

How can a developer meet these requirements?

- A. Create an Amazon Cognito identity pool, configure the Amazon Cognito Authorizer in API Gateway, and use the temporary credentials generated by the identity pool.
- B. Create and maintain a database record for each user with a corresponding token and use an AWS Lambda authorizer in API Gateway.
- C. Create an IAM user for each API user, attach an invoke permissions policy to the API, and use an IAM authorizer in API Gateway.
- **D. Create an Amazon Cognito user pool, configure the Cognito Authorizer in API Gateway, and use the identity or access token.**

Answer: D

NEW QUESTION # 493

A company has an application that uses Amazon Cognito user pools as an identity provider. The company must secure access to user records. The company has set up multi-factor authentication (MFA). The company also wants to send a login activity notification by email every time a user logs in.

What is the MOST operationally efficient solution that meets this requirement?

- A. Configure Amazon Cognito to stream all logs to Amazon Kinesis Data Firehose. Create an AWS Lambda function to process the streamed logs and to send the email notification based on the login status of each user.
- B. Create an AWS Lambda function that uses Amazon Simple Email Service (Amazon SES) to send the email notification. Add an Amazon API Gateway API to invoke the function. Call the API from the client side when login confirmation is received.
- C. Create an AWS Lambda function that uses Amazon Simple Email Service (Amazon SES) to send the email notification. Create an Amazon CloudWatch Logs log subscription filter to invoke the function based on the login status.
- **D. Create an AWS Lambda function that uses Amazon Simple Email Service (Amazon SES) to send the email notification. Add an Amazon Cognito post authentication Lambda trigger for the function.**

Answer: D

Explanation:
