Our ISACA CDPSE practice exam simulator mirrors the ISACA CDPSE exam experience, so you know what to anticipate on Certified Data Privacy Solutions Engineer day. Our ISACA CDPSE practice test software features various question styles and levels, so you can customize your ISACA CDPSE Exam Questions preparation to meet your needs.

Get to know about the certification Worth of the Isaca CDPSE Certification Exam

In this era of digital transformation, the need for privacy is greater than ever. It is very important to ensure the privacy of data that is stored on servers. Data privacy is not a new concept, but it is gaining more importance in the present day due to its potential impact on business. In recent years, the number of cybersecurity breaches has increased, and businesses have been hacked. This has increased the importance of data privacy in the modern era. Minute exam connected with the latest developments in information technology. **CDPSE Dumps** is a highly recommended exam preparation tool.

The most updated and valid data privacy solutions are required in the modern-day. Therefore, the importance of this certification has increased. Configure and manage network security. The candidate who has passed the Isaca CDPSE Certification Exam will be able to assess the privacy of the data that is stored on servers. The candidate will also be able to develop and implement a comprehensive privacy solution. In this way, the candidate can ensure the security and privacy of data that is stored on servers. Annually, the candidate who has passed the Isaca CDPSE Certification Exam will be able to mitigate the risk of cyberattacks and data breaches. Certification earners trust that this certification will help them to achieve the above goals.

The CDPSE exam covers four key domains: Data Privacy Governance, Data Privacy Architecture, Data Privacy Operations, and Data Privacy and Security Technical Controls. CDPSE exam consists of 150 multiple-choice questions, and candidates have four hours to complete it. To be eligible for the exam, candidates must have a minimum of five years of experience in data privacy or a related field, with at least three years of experience in consulting, designing, implementing, or managing data privacy solutions.

Test CDPSE Questions & CDPSE Reasonable Exam Price

We are impassioned, thoughtful team. So our CDPSE exam torrents will never put you under great stress but solve your problems with efficiency. Otherwise if you fail to pass the exam unfortunately with our CDPSE test braindumps, we will return your money fully or switch other versions for you. So by using our CDPSE exam torrents made by excellent experts, the learning process can be speeded up to one week. They have taken the different situation of customers into consideration and designed practical CDPSE Test Braindumps for helping customers save time. As elites in this area they are far more proficient than normal practice materials' editors, you can trust them totally.

ISACA CDPSE certification exam is a valuable credential for IT professionals who are responsible for developing, implementing, and managing data privacy solutions in an organization. Certified Data Privacy Solutions Engineer certification demonstrates an individual's expertise in data privacy solutions engineering and their commitment to professional development. Certified Data Privacy

Solutions Engineer certification is recognized globally and is highly respected by employers. The CDPSE Certification provides individuals with a competitive advantage in the job market and access to a global network of professionals working in the same field.

ISACA Certified Data Privacy Solutions Engineer Sample Questions (Q239-Q244):

NEW QUESTION # 239

It is MOST important to consider privacy by design principles during which phase of the software development life cycle (SDLC)?

- A. Requirements definition
- B. Implementation
- C. Application design
- D. Testing

Answer: A

Explanation:

Requirements definition is a phase of the software development life cycle (SDLC) that involves gathering, analyzing and documenting the functional and non-functional requirements of the software system or application, such as features, performance, security and usability. It is most important to consider privacy by design principles during this phase, as it would help to ensure that privacy is embedded and integrated into the software system or application from the outset, rather than as an afterthought or an add-on. Considering privacy by design principles during requirements definition would also help to avoid costly rework or delays later in the SDLC, as well as to enhance customer trust and satisfaction, and comply with privacy laws and regulations. The other options are not as important as requirements definition in considering privacy by design principles. Application design is a phase of the SDLC that involves creating and specifying the architecture, components, interfaces and data models of the software system or application, based on the requirements defined in the previous phase. Implementation is a phase of the SDLC that involves coding, testing and debugging the software system or application, based on the design specifications created in the previous phase. Testing is a phase of the SDLC that involves verifying and validating that the software system or application meets the requirements and expectations of the users and stakeholders, as well as identifying and fixing any defects or errors¹, p. 88-89 Reference: 1: CDPSE Review Manual (Digital Version)

NEW QUESTION # 240

When data processing is performed at a third-party data center, ownership of the risk PRIMARILY rests with the:

- A. Data scientist
- B. Data custodian
- C. Data controller
- D. Data processor

Answer: C

Explanation:

The data controller determines the purposes and means of processing and therefore retains primary accountability for risk-even if a processor or custodian executes processing. Data processors (C) act under instructions; custodians (A) safeguard data but do not define processing; data scientists (B) are operational users, not accountable owners.

"The data controller remains accountable for compliance and risk regardless of outsourcing processing activities."

NEW QUESTION # 241

Which of the following is MOST important when developing an organizational data privacy program?

- A. Following an established privacy framework
- B. Performing an inventory of all data
- C. Profiling current data use
- D. Obtaining approval from process owners

Answer: A

Explanation:

Explanation:

Following an established privacy framework is the most important step when developing an organizational data privacy program because it provides a structured and consistent approach to identify, assess, and manage privacy risks and compliance obligations. A privacy framework can also help to align the privacy program with the organization's strategic goals, values, and culture, as well as to communicate and demonstrate the privacy program's effectiveness to internal and external stakeholders. Some examples of established privacy frameworks are the NIST Privacy Framework, the ISO/IEC 27701:2019, and the AICPA Privacy Maturity Model.

References:

- * NIST Privacy Framework: A Tool for Improving Privacy through Enterprise Risk Management, NIST
- * ISO/IEC 27701:2019 Security techniques - Extension to ISO/IEC 27001 and ISO/IEC 27002 for privacy information management - Requirements and guidelines, ISO
- * Privacy Maturity Model, AICPA

NEW QUESTION # 242

An increase in threats originating from endpoints is an indication that:

- A. extended detection and response should be installed.
- B. network audit frequency should increase.
- C. network protection should be maintained remotely.
- D. credential management should be implemented.

Answer: A

Explanation:

Explanation

Extended detection and response (XDR) is a security solution that collects and analyzes data from multiple sources, such as endpoints, networks, servers, cloud, and applications, to detect and respond to threats in real time. XDR should be installed to address the increase in threats originating from endpoints, as it provides a holistic and integrated view of the threat landscape, as well as automated and coordinated actions to contain and remediate the threats. XDR also helps to improve the visibility, efficiency, and effectiveness of the security operations, as well as to reduce the complexity and costs of managing multiple security tools.

NEW QUESTION # 243

Which of the following protocols BEST protects end-to-end communication of personal data?

- A. Transport Layer Security Protocol (TLS)
- B. Secure File Transfer Protocol (SFTP)
- C. Hypertext Transfer Protocol (HTTP)
- D. Transmission Control Protocol (TCP)

Answer: A

Explanation:

Reference:

Transport Layer Security Protocol (TLS) is a cryptographic protocol that provides end-to-end communication security between two parties over a network, such as the internet. TLS protects the confidentiality, integrity and authenticity of the data exchanged between the parties, such as personal data, by using encryption, hashing and digital signatures. TLS is the best protocol to protect end-to-end communication of personal data, as it prevents unauthorized access, modification or tampering of the data by third parties or intermediaries. The other options are not as effective as TLS in protecting end-to-end communication of personal data. Transmission Control Protocol (TCP) is a network protocol that provides reliable and ordered delivery of data packets between two parties over a network, but it does not provide any security or encryption of the data. Secure File Transfer Protocol (SFTP) is a network protocol that provides secure and encrypted file transfer between two parties over a network, but it does not provide end-to-end communication security for other types of data or messages. Hypertext Transfer Protocol (HTTP) is a network protocol that defines how data is formatted and transmitted over the web, but it does not provide any security or encryption of the data. 1, p. 90-91 Reference: 1: CDPSE Review Manual (Digital Version)
