Juniper Automation and DevOps, Associate (JNCIA-DevOps) Sample Questions (Q62-Q67):

NEW QUESTION # 62
You want to make a list in Python to store data.
Which statement is the correct way to accomplish this task?

- A. L = (0, 1, 2, 3, 4, 5)
- B. L = {0, 1, 2, 3, 4, 5}
- C. L = [0, 1, 2, 3, 4, 5]
- D. L = "0, 1, 2, 3, 4, 5"

Answer: C

Explanation:
In Python, to create a list, you use square brackets []. The correct syntax to create a list containing the numbers 0 through 5 is:
L = [0, 1, 2, 3, 4, 5]
This statement creates a list object that stores the specified integers.
Other options are incorrect:
A defines a string, not a list.
B defines a set, which is an unordered collection with no duplicate elements.

D defines a tuple, which is an immutable sequence, not a list.
Reference:
Python Official Documentation: Discusses lists, sets, tuples, and their syntaxes.
Python Data Structures Guide: Provides examples of creating and manipulating lists.

NEW QUESTION # 63

Which statement is valid regarding YAML and JSON?

- A. White space is ignored in YAML and JSON.
- B. YAML and JSON use indentation.
- C. Comments are available in YAML and JSON.
- D. YAML and JSON are case-sensitive.

Answer: D

Explanation:
Both YAML and JSON are case-sensitive, meaning that the distinction between uppercase and lowercase characters matters. For example, in JSON or YAML, Key and key would be considered different.
Option D (case-sensitive) is correct because both YAML and JSON treat keys and values with different cases as distinct.
Option A is incorrect because, while JSON does not use indentation, YAML does rely on indentation to define structure. Option B is incorrect because whitespace can be significant in YAML for structure, and Option C is incorrect because JSON does not support comments, while YAML does.
Supporting Reference:
YAML and JSON Documentation: The official specifications for both YAML and JSON emphasize their case sensitivity.

NEW QUESTION # 64

Which two programming languages have a NETCONF library supported by Juniper Networks? (Choose two.)

- A. SLAX
- B. Go
- C. Python
- D. Ruby

Answer: B,C

Explanation:
Juniper Networks supports NETCONF libraries for several programming languages, including:
Python (B): Python has a well-supported NETCONF library called ncclient, which is widely used for automating network configurations across Junos devices.
Go (C): Go also has a NETCONF library (go-netconf), which provides similar functionalities for managing Junos devices.
Ruby (A) and SLAX (D) do not have widely recognized or supported NETCONF libraries directly from Juniper Networks, making Python and Go the correct choices.
Reference:
Juniper Networks NETCONF Documentation: Lists supported programming languages and libraries for interacting with NETCONF on Junos devices.
ncclient Documentation: The primary Python library for working with NETCONF.

NEW QUESTION # 65

Exhibit.

Referring to the exhibit, which statement about REST is correct?

- A. The device is configured to allow HTTPS connections on port 3443.
- B. The device is configured to allow HTTP connections on port 3030.
- C. The device is configured to allow only two simultaneous REST connections.
- D. The device is configured to allow connections from the REST API Explorer

Answer: A

NEW QUESTION # 66

Which two statements about the REST API are correct? (Choose two.)

- A. The REST API application is stateful.
- B. The TCP session state is maintained by the server.
- C. The TCP session state is maintained by the client
- D. The REST API application is stateless.

Answer: C,D

Explanation:
REST (Representational State Transfer) is an architectural style for designing networked applications, and its key principles include:
Statelessness (B): Each request from the client to the server must contain all the information needed to understand and process the request. The server does not store any session state between requests, meaning each request is independent and does not rely on previous ones.
TCP Session State (C): While REST itself is stateless, the underlying TCP connection's state, such as keeping the connection alive or managing retries, is handled by the client. The server does not retain information about the TCP connection beyond the processing of the individual request.
Options A and D are incorrect because they imply that the REST API is stateful, which contradicts the stateless nature of REST.
Reference:
REST API Design Principles: Describes the stateless nature of REST and the responsibility of clients in managing session state.
Web Development Documentation: Discusses how REST APIs operate, focusing on statelessness and client-server interaction.
