

C_DBADM_2601최신덤프공부자료, C_DBADM_2601적 중율높은덤프공부

다른 방식으로 같은 목적을 이룰 수 있다는 점 아세요? 여러분께서는 어떤 방식, 어느 길을 선택하시겠습니까? 많은 분들은 SAP인증 C_DBADM_2601 시험패스로 자기 일에서 생활에서 한층 업그레이드 되기를 바랍니다. 하지만 모두 다 알고 계시는 그대로 SAP인증 C_DBADM_2601 시험은 간단하게 패스할 수 있는 시험이 아닙니다. 많은 분들이 SAP인증 C_DBADM_2601 시험을 위하여 많은 시간과 정신력을 투자하고 있습니다. 하지만 성공하는 분들은 적습니다.

SAP C_DBADM_2601 Exam Syllabus Topics:

Section	Weight	Objectives
SAP HANA Architecture and Deployment	11% - 20%	- Deployment options: on-premise and cloud - Architecture components and concepts - Installation and upgrade procedures
Migration and Integration	11% - 20%	- Integration with SAP systems - Data movement and replication - Migration to SAP HANA Cloud
Database Security	11% - 20%	- Audit and compliance - Data protection and access control - Security settings and encryption
Monitoring and Troubleshooting	11% - 20%	- Monitoring tools and metrics - Problem diagnosis and resolution - Performance analysis and optimization
Backup and Recovery	11% - 20%	- Backup strategies and execution - Recovery procedures and scenarios - High availability and disaster recovery

- System configuration and parameters
Database Administration and Configuration 11% - 20% - User and authorization management
- Resource management and allocation

최근 인기시험 C_DBADM_2601 최신 덤프 공부자료 덤프문제보기

DumpTOP에서 출시한 SAP인증C_DBADM_2601 덤프는 시험문제점유율이 가장 높은 시험대비자료입니다. 실제 SAP인증C_DBADM_2601 시험문제유형과 같은 형식으로 제작된 SAP인증C_DBADM_2601 시험공부자료로서 DumpTOP 덤프의 실용 가치를 자랑하고 있습니다. 덤프를 공부하여 시험불합격하시면 덤프비용은 환불처리해드립니다.

최신 SAP Certification Exams C_DBADM_2601 무료 샘플문제 (Q196-Q201):

질문 # 196

A regional university administration team maintains SAP HANA for student services analytics. After a minor configuration update, SAP HANA cockpit shows the database as running, but the scheduled administrative job that confirms configuration status reports "not executed." The job owner still has access, and the configuration worksheet shows the expected values entered before the update.

The constraint is that the administrator must confirm whether the configured state was actually validated after the change. The operations lead will not accept manual worksheet entries as proof that post-change administration checks were completed. Which action best resolves the validation gap?

- A. Confirm the database is running and close the change because the job owner still has access.
- B. Re-enter the expected configuration values from the worksheet and mark the job status as complete.
- C. Execute or reschedule the administrative validation job, confirm the active configuration result, and update the change record with the post-change evidence.
- D. Assign a different job owner so the administrative job has a fresh authorization context.

정답: C

설명:

Feedback:

This addresses the execution and validation layer. Running or rescheduling the job links the entered configuration, active runtime result, administrative check execution, and change-record evidence.

질문 # 197

A subscription services provider operates SAP HANA in a mixed environment. After a planned configuration adjustment intended to improve throughput, administrators observe that nightly batch processing finishes on time, but interactive analyst queries now show intermittent delays. Monitoring shows no broad system outage, and memory consumption remains stable. CPU peaks occur only during specific interactive workload windows.

The platform owner wants a correction that preserves the batch improvement while avoiding a broad reversal of the recent tuning changes. The team must decide based on actual workload behavior rather than a general assumption that the entire configuration set should be rolled back.

What is the best next step?

- A. Reverse all recent configuration changes immediately because any slowdown after tuning proves the full change set was invalid.
- B. Increase system memory allocation first because stable memory use indicates the system is close to its capacity boundary.
- C. Compare the changed configuration against the affected workload pattern and adjust only the setting that is degrading interactive execution behavior.
- D. Move the interactive workload to the cloud database without further analysis because the current landscape already supports mixed deployment.

정답: C

질문 # 198

CHALLENGE 4 - Service Continuity Recovery Gate

Backups completed for the upgraded service reporting system and the installed stabilization database before the hypercare review. Recovery validation for the stabilization database is scheduled but not complete, and the upgraded system has only backup completion evidence. What should happen before hypercare readiness supports service approval?

- A. Replace recovery validation with dashboard availability because this is not a production outage.
- B. Perform recovery validation only if reporting becomes unavailable during hypercare.
- C. Accept readiness because completed backups are enough for service reporting continuity.
- **D. Complete recovery validation and document startup behavior for the readiness systems.**

정답: D

설명:

Feedback:

Recovery validation and startup behavior should be completed before hypercare readiness supports service approval. Backup completion supports continuity planning, but it does not prove recoverability.

질문 # 199

CHALLENGE 1 - Cutover Configuration Evidence Traceability

During cutover readiness rehearsal, warehouse test users can open freight capacity reports from both SAP HANA systems. The installed validation database has its active configuration documented, but the upgraded distribution reporting system has one stabilization value recorded only in monitoring notes. What should the administrator do before accepting the cutover comparison?

- A. Continue cutover preparation and review the monitoring notes only if users report inconsistent results.
- B. Accept the comparison because both systems return the required reports during rehearsal.
- **C. Reconcile the stabilization value into the upgraded system's current administration record.**
- D. Remove the documented value from the validation database record so both systems appear aligned.

정답: C

설명:

Feedback:

The administrator should reconcile the stabilization value into the current administration record before accepting the comparison. Report access does not prove that both SAP HANA systems are being evaluated against documented active states.

질문 # 200

A regional public transit operator runs SAP HANA on-premises for ridership analytics and has a separate SAP HANA Cloud evaluation instance for future reporting modernization. During an operations handover, the administrator finds that the support matrix lists both environments under one administrator contact and one validation checklist. SAP HANA cockpit evidence exists for the on-premises workload, while SAP HANA Cloud Central evidence exists for the evaluation instance.

The constraint is that first-level support must route operational incidents correctly without confusing active production administration with cloud evaluation readiness. The support matrix must remain useful for both environments.

Which action best corrects the support matrix?

- **A. Separate the support matrix entries by active on-premises workload and SAP HANA Cloud evaluation instance, with each mapped to its own validation evidence.**
- B. Assign all incidents to the cloud evaluation contact because modernization planning is already in progress.
- C. Remove the SAP HANA Cloud evaluation instance until it becomes the active reporting environment.
- D. Keep one support matrix entry because both systems are administered within the SAP HANA database administration scope.

정답: A

설명:

Feedback:

This corrects the environment-role mapping at the support and validation layer. Separating active workload administration from cloud evaluation readiness aligns incident routing, evidence source, operational responsibility, and later modernization tracking.

질문 # 201
