We have compiled the Identity-and-Access-Management-Architect test guide for these candidates who are trouble in this exam, in order help they pass it easily, and we deeply believe that our Identity-and-Access-Management-Architect exam questions can help you solve your problem. Believe it or not, if you buy our study materials and take it seriously consideration, we can promise that you will easily get the certification that you have always dreamed of. We believe that you will never regret to buy and practice our Identity-and-Access-Management-Architect latest question.

Salesforce Certified Identity and Access Management Architect Sample Questions (Q66-Q71):

NEW QUESTION # 66

A security architect is rolling out a new multi-factor authentication (MFA) mandate, where all employees must go through a secure authentication process before accessing Salesforce. There are multiple Identity Providers (IdP) in place and the architect is considering how the "Authentication Method Reference" field (AMR) in the Login History can help.

Which two considerations should the architect keep in mind?

Choose 2 answers

- A. Dependency on what is supported by OpenID Connect (OIDC) implementation at IdP.
- B. High-assurance sessions must be configured under Session Security Level Policies.
- C. AMR field shows the authentication methods used at IdP.
- D. Both OIDC and Security Assertion Markup Language (SAML) are supported but AMR must be implemented at IdP.

Answer: C,D

Explanation:

Explanation

The AMR field in the Login History shows the authentication methods used at the IdP level, such as password, MFA, or SSO. Both OIDC and SAML are supported protocols for SSO, but the IdP must implement the AMR attribute and pass it to Salesforce.

NEW QUESTION # 67

Universal containers (UC) has a mobile application that calls the salesforce REST API. In order to prevent users from having to enter their credentials everytime they use the app, UC has enabled the use of refresh Tokens as part of the salesforce connected App and updated their mobile app to take advantage of the refresh token. Even after enabling the refresh token, Users are still complaining that they have to enter their credentials once a day. What is the most likely cause of the issue?

- A. The Oauth authorizations are being revoked by a nightly batch job.
- B. The refresh token expiration policy is set incorrectly in salesforce
- C. The users forget to check the box to remember their credentials.
- D. The app is requesting too many access Tokens in a 24-hour period

Answer: B

Explanation:

The most likely cause of the issue is that the refresh token expiration policy is set incorrectly in Salesforce. A refresh token is a credential that allows a connected app to obtain a new access token when the previous one expires¹. The refresh token expiration policy determines how long a refresh token is valid for². If the policy is set to a short duration, such as 24 hours, the users have to enter their credentials once a day to get a new refresh token. To prevent this, the policy should be set to a longer duration, such as "Refresh token is valid until revoked" or "Refresh token expires after 90 days of inactivity"².

NEW QUESTION # 68

Universal Containers (UC) is looking to purchase a third-party application as an Identity Provider. UC is looking to develop a business case for the purchase in general and has enlisted an Architect for advice. Which two capabilities of an Identity Provider should the Architect detail to help strengthen the business case?

Choose 2 answers

- A. The Identity Provider can centralize enterprise password policy.
- B. The Identity provider can store credentials for multiple applications.
- C. The Identity Provider can authenticate multiple applications.
- D. The Identity Provider can authenticate multiple social media accounts.

Answer: A,C

Explanation:

Explanation

The two capabilities of an identity provider that the architect should detail to help strengthen the business case are that the identity provider can authenticate multiple applications and that the identity provider can centralize enterprise password policy. These capabilities can provide benefits such as reducing login friction, improving user experience, enhancing security, and simplifying administration. Option B is not a good choice because the identity provider can authenticate multiple social media accounts may not be relevant for UC's business case, as it does not specify how UC will use social media for its identity management. Option C is not a good choice because the identity provider can store credentials for multiple applications may not be desirable or secure for UC's business case, as it may imply that the identity provider is using password vaulting or federation rather than single sign-on (SSO) or identity federation. NEW QUESTION # 69

Universal Containers (UC) has decided to use Salesforce as an Identity Provider for multiple external applications. UC wants to use the Salesforce App Launcher to control the Apps that are available to individual users. Which three steps are required to make this happen?

- A. Add each connected App to the App Launcher with a Start URL.
- B. Set up Identity Connect to Synchronize user data.
- C. Set up Salesforce as a SAML Idp with My Domain.
- D. Create a Connected App for each external application.
- E. Set up an Auth Provider for each External Application.

Answer: A,C,D

Explanation:

Explanation

These are the steps required to enable Salesforce as a SAML Identity Provider and use the App Launcher to access external applications. According to the Salesforce documentation¹, you need to:

Enable Salesforce as a SAML Identity Provider with My Domain².

Create a Connected App for each external application that you want to integrate with Salesforce³.

Add each Connected App to the App Launcher with a Start URL that points to the external application¹.

Option B is incorrect because setting up an Auth Provider is not necessary for SAML SSO. Auth Providers are used for OAuth SSO, which is a different protocol⁴. Option D is incorrect because Identity Connect is a tool for synchronizing user data between Active Directory and Salesforce, which is not related to SSO or App Launcher⁵.

NEW QUESTION # 70

Universal Containers (UC) is concerned that having a self-registration page will provide a means for "bots" or unintended audiences to create user records, thereby consuming licenses and adding dirty data. Which two actions should UC take to prevent unauthorized form submissions during the self-registration process? Choose 2 answers

- A. Primarily use lookup and picklist fields on the self-registration page.
- B. Use open-ended security questions and complex password requirements
- C. Require a captcha at the end of the self-registration process.
- D. Use hidden fields populated via JavaScript events in the self-registration page.

Answer: C,D

Explanation:

Explanation

To prevent unauthorized form submissions during the self-registration process, UC should require a captcha at the end of the self-registration process and use hidden fields populated via JavaScript events in the self-registration page. These methods will help to verify that the user is a human and not a bot, and also to validate the user's input against some predefined values. Option A is not a good choice because open-ended security questions and complex password requirements may frustrate the user and reduce the conversion rate.

Option B is not a good choice because lookup and picklist fields may not prevent bots from submitting the form, as they can be easily automated or bypassed.
