Fortinet FCSS - LAN Edge 7.6 Architect Sample Questions (Q23-Q28):

NEW QUESTION # 23

You are configuring FortiAuthenticator to integrate with FSSO for user identification. To enable FortiAuthenticator to extract user information from syslog messages and inject it into FSSO, you have configured syslog matching rules. What is the role of syslog matching rules in the process of injecting user information into FSSO?

- A. To filter and block irrelevant syslog messages from being processed by the FortiAuthenticator
- B. To define how syslog messages are parsed and extract user information, such as usernames and IP addresses
- C. To enforce user authentication policies based on syslog message contents
- D. To automatically update user group memberships in FSSO based on syslog events

Answer: B

Explanation:

When FortiAuthenticator is used as an FSSO agent based on syslog, it must:

- * Parse incoming syslog messages from devices (firewalls, WLAN controllers, VPN concentrators, etc.).
- * Extract identity fields such as:
 - * Username
 - * IP address
 - * Login/logout event indicators

Syslog matching rules on FortiAuthenticator define:

- * Which syslog messages are relevant (by facility, message pattern, or regex).
- * How to capture specific fields (username, IP, group, event type).

FortiAuthenticator then uses this parsed data to inject logon sessions into FSSO, so FortiGate can apply identity-based policies.

Thus, the role of syslog matching rules is exactly as described in C.

- * A: Group mapping is handled separately via directory groups / FSSO config, not directly by matching rules.
- * B: Enforcement of authentication policies is done on FortiGate, not directly by the matching rules.
- * D: While irrelevant logs can be ignored via rules, the primary purpose is parsing and extraction, not generic filtering.

NEW QUESTION # 24

What is the primary function of a captive portal in guest Wi-Fi onboarding?

Response:

- A. Force client to use VPN
- B. Automatically redirect traffic to DNS
- C. Encrypt all packets using SSL
- D. Allow access only after user authentication or acceptance

Answer: D

Which include debug output and SSL VPN configuration details.

An SSL VPN has been configured on FortiGate. To enhance security, the administrator enabled Required Client Certificate in the SSL VPN settings. However, when a user attempts to connect, authentication fails.

Which configuration change is needed to fix the issue and allow the user to connect?

- A. Enable Redirect HTTP to SSL-VPN on the SSL VPN configuration page.
- **B. Import the CA that signed the user certificate to FortiGate.**
- C. Import the CA that signed the SSL VPN Server Certificate to FortiGate.
- D. Set the user certificate as the Server Certificate on the SSL VPN configuration page.

Answer: B

Explanation:

The SSL-VPN configuration has Require Client Certificate enabled. When this is enabled, FortiOS performs two checks:

* Normal user authentication (username/password or PKI user)

* Additional client certificate check- the client certificate must be signed by a CA that FortiGate trusts FortiOS documentation for "SSL VPN with certificate authentication" states:

- * "The client certificate only needs to be signed by a known CA in order to pass authentication."
- * "The CA certificate is the certificate that signed both the server certificate and the user certificate... The CA certificate is available to be imported on the FortiGate."

The debug output shows key lines:

- * `_quick_check_peer-CA` does not match.
- * Issuer of cert depth 0 is not detected in CMDB.

This tells us:

- * FortiGate does see the user's certificate,
- * But cannot find the issuing CA in its local CA certificate store ("CMDB" = configuration database).

This means the CA that signed the user certificate has not been imported into FortiGate.

Now evaluate the options:

- * A. Enable Redirect HTTP to SSL-VPN- affects only redirection from HTTP to HTTPS; it has nothing to do with certificate validation.
- * B. Import the CA that signed the SSL VPN Server Certificate- the server certificate is already working (the portal comes up) and its CA is not what the debug complains about; the error is about the peer (user) certificate. Often the same CA signs both, but the failing check specifically says the issuer of the client cert is not in CMDB.
- * C. Set the user certificate as the Server Certificate- incorrect; server and client certificates serve different roles.
- * D. Import the CA that signed the user certificate to FortiGate- this directly addresses the debug error and aligns with the documented requirement that the CA which issued the user certificate must be known to FortiGate.

NEW QUESTION # 26

How can FortiAI Ops help optimize network performance in an SD-Branch deployment with FortiGate, FortiSwitch, and FortiAP?

- A. It disables low-performing APs and switches automatically.
- B. It predicts and resolves all network issues without any human intervention.
- C. It removes the need for SD-WAN configuration by automating all routing decisions.
- **D. It uses AI-driven analytics to identify network issues and provide optimization recommendations.**

Answer: D

Explanation:

In an SD-Branch deployment (FortiGate + FortiSwitch + FortiAP), FortiAI Ops:

- * Collects telemetry and logs from Fabric devices
- * Uses machine-learning / AI analytics to:
 - * Spot anomalies (latency, packet loss, RF issues, misconfigurations)
 - * Highlight root causes
 - * Propose optimization recommendations (e.g., channel changes, power tuning, config fixes) It does not:
 - * Automatically disable devices (A false)
 - * Replace SD-WAN config or all routing (C false)
 - * Fix all issues with zero human input (D is marketing fantasy, not reality)

NEW QUESTION # 27

You want to configure Syslog-based single sign-on (SSO) on FortiAuthenticator to enhance user authentication across your network. You have to ensure that the system correctly extracts the user information from syslog messages and links it to the correct authentication events.

Which two steps must you perform to successfully configure Syslog SSO on FortiAuthenticator?

(Choose two.)

Response:

- A. Enable syslog forwarding on source devices.
- B. Set up user authentication policies in FortiAuthenticator.
- **C. Specify the devices that will send syslog messages to FortiAuthenticator.**
- D. Configure the syslog messages that FortiAuthenticator sends to authentication devices.
- **E. Configure parsing rules to extract the relevant information from syslog messages.**

Answer: C,E
