100% Pass Quiz 220-1101 - CompTIA A+ Certification Exam: Core 1 Newest Study Center

In order to gain the 220-1101 certification quickly, people have bought a lot of 220-1101 study materials, but they also find that these materials don't suitable for them and also cannot help them. If you also don't find the suitable 220-1101 test guide, we are willing to recommend that you should use our 220-1101 Study Materials. Because our products will help you solve the problem, it will never let you down if you decide to purchase and practice our 220-1101 latest question. And our 220-1101 exam questions have a high pass rate of 99% to 100%.

CompTIA A+ Certification Exam: Core 1 Sample Questions (Q41-Q46):

NEW QUESTION # 41

A user plugs in a laptop to the corporate network and the laptop is automatically assigned an IP address. Which of the following server types was used to assign the IP address?

- A. DHCP
- B. AAA
- C. DNS
- D. Web

Answer: A

Explanation:

When a device such as a laptop is connected to a network and automatically assigned an IP address, it is typically done through DHCP (Dynamic Host Configuration Protocol). DHCP servers are responsible for dynamically assigning IP addresses to devices on a network, ensuring that each device has a unique IP address and can communicate on the network without IP conflicts.

References:

* CompTIA A+ Core 1 (220-1101) Exam Objectives, especially sections dealing with networking fundamentals and configurations, which would include the role and function of DHCP in managing IP address allocation on networks.

* Understanding of basic networking protocols and services, highlighting DHCP's role in dynamically allocating IP addresses to devices on a network to facilitate communication.

NEW QUESTION # 42

Which of the following frequency bands do 802.11b and 802.11g operate in?

- A. 1GHz
- B. 2.4GHz
- C. 5GHz
- D. 6GHz

Answer: B

Explanation:

The frequency bands that 802.11b and 802.11g operate in are 2.4GHz bands, which allow for longer range but lower speed than higher frequency bands such as 5GHz or 6GHz bands used by newer standards such as 802.11a/n/ac/ax.

NEW QUESTION # 43

A user tries to connect a monitor to a laptop to have an additional screen for work, but both screens show the same content. Which of the following should the user do to resolve the issue?

- A. Configure the Windows tiling feature to display multiple windows.
- B. Purchase a docking station to connect both the laptop and the monitor.
- C. Use the Add New Hardware assistant to add the monitor and set up the required settings.
- D. Go to the Display settings and configure the external monitor as extended.

Answer: D

Explanation:

Configuring the monitor as an "extended" display will allow the laptop and monitor to show different content.

By default, laptops mirror displays, so this setting change enables dual display functionality. This is covered under CompTIA Core 1 exam objectives for managing display configurations and settings.

NEW QUESTION # 44

A user is unable to access the internet on a PC. A technician examines the PC and runs the following commands:

```
ipconfig /all
ping 8.8.8.8
ping comp-tia.org
```

Which of the following steps in the troubleshooting process does this series of commands represent?

- A. Establish a theory.
- B. Identify the problem.
- C. Verify full system functionality.
- D. Establish a plan of action.

Answer: C

NEW QUESTION # 45

A technician is using a PAN to connect a group of users on a field project. Which of the following services should the technician activate on the mobile device to share the internet data connection?

- A. Tethering
- B. Bluetooth
- C. Pairing
- D. Hotspot

Answer: A

Explanation:

Explanation

The correct answer is A. Tethering.

Tethering is the process of sharing a mobile device's internet data connection with other devices, such as laptops, tablets, or other phones. Tethering can be done by using a Wi-Fi hotspot, a Bluetooth connection, or a USB cable. A Wi-Fi hotspot creates a wireless network that other devices can join, a Bluetooth connection pairs the devices and allows data transfer, and a USB cable connects the devices physically and enables data sharing.

A PAN, or personal area network, is a type of network that connects devices within a short range, usually up to 10 meters. A PAN can be used for various purposes, such as transferring files, printing documents, or accessing the internet. A PAN can be created by using Bluetooth, Wi-Fi, or infrared technologies.

A technician can use a PAN to connect a group of users on a field project by using tethering on a mobile device. The technician can activate the tethering service on the mobile device and choose the preferred method of sharing the internet data connection. The other devices can then connect to the mobile device and access the internet through it.

The other options are incorrect because they are not services that can share the internet data connection on a mobile device. Pairing is the process of establishing a connection between two Bluetooth devices, but it does not necessarily share the internet data connection. Bluetooth is a technology that can create a PAN and enable tethering, but it is not a service that can be activated on a mobile device. Hotspot is a term that can refer to a Wi-Fi hotspot created by tethering on a mobile device, but it is not a service that can be activated on its own.
