CompTIA A+ Certification Exam: Core 2 Sample Questions (Q98-Q103):

NEW QUESTION # 98

Which of the following authentication methods is the best way to prevent users from frequently entering their credentials?

- A. Multifactor authentication
- B. One-time password
- C. Single sign-on
- D. Access control list

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Single sign-on (SSO) allows users to authenticate once and gain access to multiple systems without re-entering credentials, which significantly enhances user convenience while maintaining security.

From Quentin Docter - CompTIA A+ Complete Study Guide:

"Single sign-on streamlines authentication by allowing users to log in once and access all authorized resources, reducing credential fatigue and improving security."

NEW QUESTION # 99

A technician is working on multiple remote machines using a command line. Which of the following commands should the technician use to verify which SMB shares are currently mapped?

- A. net use
- B. hostname
- C. systeminfo
- D. nslookup

Answer: A

Explanation:

The correct answer is C. net use, which is the Windows command-line utility used to display, create, and remove mapped network drives and SMB (Server Message Block) connections. When working remotely through command-line interfaces, technicians often rely on net use to quickly verify which network shares are currently connected.

The Quentin Docter - CompTIA A+ Complete Study Guide explains that SMB is the protocol Windows uses for file and printer sharing, and mapped drives are maintained through SMB sessions. The net use command lists all active connections, including the drive letter, remote UNC path, and connection status.

The Travis Everett & Andrew Hutz - All-in-One Exam Guide highlights that net use is especially valuable for remote troubleshooting because it does not require a graphical interface. This makes it ideal when administering multiple systems via command prompt or remote shell.

The Mike Meyers / Mark Soper Lab Manual clarifies that systeminfo displays OS and hardware details, hostname only shows the system name, and nslookup is used for DNS queries. None of those commands provide information about mapped SMB shares. Since the task is to verify existing SMB mappings, net use is the only command that directly fulfills this requirement, making C the correct answer.

NEW QUESTION # 100

An application's performance is degrading over time. The application is slowing, but it never gives an error and does not crash. Which of the following tools should a technician use to start troubleshooting?

- A. Reliability history
- B. Computer management
- **C. Resource monitor**
- D. Disk

Answer: C

Explanation:

Resource Monitor provides real-time insights into CPU, memory, disk, and network usage by process. By observing which resources steadily increase or become bottlenecks over time, a technician can pinpoint leaks (e.g., memory), I/O contention, or other performance issues driving the slowdown.

NEW QUESTION # 101

Which of the following is the best reason for a network engineering team to provide a help desk technician with IP addressing information to use on workstations being deployed in a secure network segment?

- A. NAC servers only allow for security updates to be installed.
- B. Only specific DNS servers are allowed outbound access.
- C. The network allow list is set to a specific address.
- **D. DHCP services are not enabled for this subnet.**

Answer: D

Explanation:

When a subnet does not offer DHCP, workstations cannot automatically obtain IP configuration.

Supplying help desk technicians with the correct static IP address, subnet mask, gateway, and DNS ensures the newly deployed machines can communicate on the secure network segment without relying on DHCP.

NEW QUESTION # 102

The battery on a user's smartphone discharges quickly when the user travels. The smartphone was replaced two weeks ago. Which of the following should a technician do first?

- A. Ensure that the charging port is working as expected
- **B. Look for applications that are reporting the highest utilization**
- C. Provide an external battery to extend the usage time
- D. Replace the battery with a higher capacity option

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

High battery drain is often due to apps running in the background or using GPS during travel. The first step should always be to check battery usage statistics to see if an application is misbehaving.

From All-in-One Exam Guide:

"Travel conditions can increase app activity, especially navigation or social media. Check app battery usage before assuming hardware faults."
